September 6, 1951

Memorandum

To: DMA Field Team, Region IV

From: Chief, Mining Division, Region IV

Subject: Final Report, Docket DMA-1019, Jas. R. Mattingley, Applicant, Tiptop and Copper Duke Copper Mines, Pima County, Arizona

The application of the subject docket was for a production loan of $22,870 for the purposes of equipping the Copper Duke mine for production at an estimated cost of $12,870, and for the exploration by diamond core drilling of the two deposits at an estimated cost of $10,000.

The mineralization consists of lenses of copper ore in limestone and quartzite near the contact with underlying granite, with some ore in the granite. The Tiptop mine has no measured nor indicated reserves. At the Copper Duke mine, past operations have removed all the ore associated with limestone above the mine workings. The measured and indicated reserves of the surface deposit at the Copper Duke mine consist of a few hundred tons of 3.0 to 3.8 percent copper.

Due to the small tonnage of low grade reserves and the geologic improbability of developing additional reserves, the examining engineer recommends denial of both the development and exploration loans, with which we concur.

REPORT OF EXAMINATION BY FIELD TEAM
REGION IV

DMA-1019. - Jas. R. Mattingly's Tiptop Group of Copper Mines

Pima County, Ariz.

T. M. Romslo, Mining Engineer
U. S. Bureau of Mines

August 1951

SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

By T. M. Remale[1]

The Tiptop group of copper mines, consisting of the Tiptop and Copper Duke mines, was examined in connection with an application to the Defense Minerals Administration for a Governmental loan of $22,870 by James R. Mattingly, 139 Custer, Evanston, Ill. The applicant proposed to equip the Copper Duke mine for production at an estimated cost of $12,870, and to explore this mine and the adjacent Tiptop mine by diamond drilling at an estimated cost of $10,000.

The Tiptop and Copper Duke mines were discovered in 1898. Production has been confined to the period, 1904 to 1906, when approximately 17,300 tons of 6.5 percent copper ore was mined from the Tiptop and 400 tons of 35 percent copper ore was produced from the Copper Duke mine. Since 1906, activity at the mines has been confined to assessment work, the uncovering of a mineralized zone at the Copper Duke in 1947 by the applicant, and the production of 105 tons of 2.8 percent copper ore by the mine owner in 1951.

On the property, pre-Cambrian granite is overlain successively by Cambrian (?) quartzite and Paleozic limestones. The sedimentary rocks occur as small pendants which are in normal and also in fault contact with the underlying widely exposed granite.

1/ Mining Engineer, Arizona-New Mexico Br., Mining Div., Region IV Bureau of Mines.

At the Tiptop mine the sedimentary rocks dip steeply. They are in contact with the granite at a shallow depth below the surface. The ore, both as oxides and sulfides of copper, occurs in altered and fractured limestone, as pockets and bunches. It is confined to a narrow zone along the limestone-quartzite contact.

At the Copper Duke mine the ore in the underground workings is associated with a thin bed of limestone. On the surface it occurs in granite and rhyolite. The underground deposits occur as small lenses at the fault contact with overlying granite and rhyolite. The ore minerals are azurite, malachite and a little chrysocolla. At the surface the same minerals are deposited in the fractured igneous rocks as blebs and discontinuous veinlets.

The applicant proposed to explore the deposits by diamond drilling 3 holes at the Copper Duke mine and 7 at the Tiptop mine at an estimated cost of $10,000. He also proposed to equip the Copper Duke mine for open-pit mining at an estimated cost of $12,870. He proposed to repay the loans from profits derived from the mining operations.

The Tiptop mine contains no measured nor indicated ore reserves. Furthermore, the following findings indicated that the possibilities of finding substantial ore reserves are unfavorable:

1. The ore, both oxides and sulfides of copper, occurred as pockets and bunches in limestone that were confined to a narrow zone near its contact with quartzite;
2. The ore occurred mainly above the lower adit and all of it is believed to have been removed by past mining operations;

3. Little or no ore was found by the lower workings that have rather thoroughly explored the favorable zone;

4. Field evidence indicates the zone favorable to ore deposition is not extensive and that all but a small portion of the zone has been explored by mine workings.

The copper deposits associated with limestone at the Copper Duke mine contain no measured nor indicated ore reserves. These deposits, as lenses of oxide ore, yielded a total of 400 tons from the zone above the adit level. It is possible that other deposits may occur at lower horizons of the limestone bed but there are no criteria for determining their probable locations. Furthermore, there is no reason to believe that such deposits would be of sufficient extent to be minable under present conditions.

The measured and indicated reserves of the surface-exposed deposit at the Copper Duke mine amount to a few hundred tons of 3.0 to 3.8 percent copper ore. The deposit is cutoff at a depth of a few feet but may extend several tens of feet into the hillside. However, field evidence indicates the inferred reserves, which may be several times the measured and indicated reserves, consist of lower grade material.

It also is concluded that ore of the grade exposed at the surface cannot be mined at a profit. Open-pit mining of the deposits might yield ore containing as high as 3 percent copper, as estimated by the applicant. Ore of this grade would have a smelter value of of $10.75 a ton. Estimated costs a ton would be: $2.00 for mining,

$2.00 for trucking, $2.31 for freight, and $4.50 smelting charges, or a total of $10.81. This indicates a loss of $0.06 a ton before royalty and taxes.

It is recommended that the applicant's request for an exploratory loan be denied because the chances of developing any ore at either the Tiptop or Copper Duke mine is unfavorable.

It also is recommended that the request for an exploitation loan be denied because the proposed operation cannot be conducted at a profit.

INTRODUCTION

This report contains information obtained during the course of an examination of the Tiptop group of copper mines, Helvetia mining district, Pima County, Ariz. It also presents an evaluation of the property as it pertains to the Defense Minerals Administration.

The examination was made in connection with an application for a Governmental loan of $22,870 by James R. Mattingly, 139 Custer, Evanston, Ill. The applicant proposed to equip the Copper Duke mine for production at an estimated cost of $12,870, and to explore this mine and the nearby Tiptop mine by diamond drilling at an estimated cost of $10,000.

The examination was made August 6 and 7, 1951 by T. M. Romslo, Bureau of Mines. It is docketed as DMA-1019.

LOCATION, TOPOGRAPHY AND CLIMATE

The Tiptop group of mines is about 28 air-miles southeast of Tucson, Ariz. (fig. 1). The property is accessible from Tucson by traveling south on U. S. highway 89 for 28 miles to the village of Sahuarita, and thence 13.4 miles southeasterly on the graded, dirt road that leads to the Helvetia mining camp. From the point that is signed, "Tip-top mine", the property is about 2.5 miles over a winding, unimproved road.

Sahuarita, on the Nogales branch of the Southern Pacific Railroad, is the nearest railroad shipping point.

FIG. I - LOCATION MAP OF
TIPTOP GROUP OF COPPER MINES
PIMA COUNTY, ARIZONA

DMA 1019 AUG. 1951

The property is on the western slope and near the northern extremity of the Santa Rita Mountains. It is at an altitude of about 4,300 feet, on the northwest slope of Tiptop Mountain. The mountain is connected to the mountain range by a cross ridge. The area of the property is moderately rugged and has a range in relief of about 200 feet. About 2 miles east of the property the mountains have a crest-line altitude of about 6,000 feet.

The climate is arid, with hot summers and mild winters.

There are no permanent streams in the district.

Vegetation is confined to native grasses, scattered bushes and cacti, mainly ocotilla. Pinon, juniper, and other conifers appear at higher altitudes.

HISTORY AND PRODUCTION

The Tiptop and Copper Duke mines were discovered and located in 1898. Little work was done at the mines until 1903 when they were acquired by the Tiptop Copper Co. The company developed both of the mines and shipped 1,000 tons of ore monthly from the Tiptop during the periods from March 1904 to June 1905, and from September 1906 to December 1906. The ore is said to have averaged about 6.5 percent copper and 0.5 ounce of silver a ton. During 1904 the company shipped about 400 tons of 35 percent copper ore from the Copper Duke mine. In December 1906, the Tiptop mine was bonded to the American Smelting & Refining Co. for $75,000. This company mined and shipped about 300 tons of ore before relinquishing the property in November 1907 to the Tiptop Copper Co.[1/]

1/ Schrader, Frank C., Mineral Deposits of the Santa Rita and Patagonia Mountains, Arizona. U.S. Geol. Surv. Bull. 582, pp. 120 to 124.

The property, which also contained the patented claims of the Bulldozer mine, was held by the Tiptop Copper Co. until 1917 when M. J. Schamorad gained possession. Shortly after Schamorad's death in 1929, the unpatented claims were relocated by Mr. and Mrs. Albert Forbes, Tucson, Ariz. In 1947, James R. Mattingly obtained control of the property under a lease and option agreement. He applied to the Reconstruction Finance Corporation in June 1947 for a mining loan. He reported that the application was withdrawn after the Corporation had examined the property because funds were not available. Shortly after the death of Albert Forbes in 1949 the property was deeded by Mrs. Forbes to her son, Denver S. Forbes.

There was no production from 1907 until 1951 when the present owner shipped 105 tons of ore containing about 3.0 percent copper and 1.5 ounce silver a ton.

PROPERTY AND OWNERSHIP

The property consists of a group of 14 unpatented mining claims in secs. 14 and 15, T. 18 S. R. 15 E., Helvetia Mining District, Pima County, Ariz. It is owned by Denver S. Forbes, 417 N. Main St., Tucson, Ariz.

The applicant holds the property on a lease and option agreement for a period of 10 years from 1947. The agreement calls for the payment of 10 percent royalty on net smelter returns on ores produced from the property.

GENERAL GEOLOGY

A coarse granite, probably of pre-Cambrian age, is the basement rock of the district. It is overlain by Cambrian (?) quartzite and Paleozoic limestones. Both the granite and the sedimentary rocks have been intruded by a stock of alaskite granite porphyry and by dikes, principally of the alaskite-aplite types. The granite occurs in both normal and fault contact with the overlying rocks.

In the vicinity of the Tiptop property most of the sedimentary rocks have been removed and the pre-Cambrian granite is exposed over much of the area.

At the Tiptop mine, the limestone and quartzite dip steeply to the east and are in contact with granite at a shallow depth below the principal workings (fig. 2). A dark gray rock, tentatively identified as rhyolite, outcrops at the north end of the mine and at the Copper Duke mine where it also is exposed in the underground workings.

At the Copper Duke mine, the granite has been intruded by rhyolite (fig. 3). In the eastern portion of the mine a nearly horizontal fault cuts the granite and also forms a contact between the granite and the overlying rhyolite. The fault zone contains a thin section of limestone.

ORE DEPOSITS

Tipton Mine

The ore occurs in limestone near its contact with quartzite. It is associated with fractures and faults, and characteristically occurs as irregular pockets and bunches. Probably all but a few hundred tons of the ore produced from the mine has come from workings above the lower adit. In general, the upper portion of this zone contained carbonate ores and the lower portion yielded sulfide ore. In this zone the ores have been deposited on quartzite and on a floor of crushed limestone cut by a net-work of quartz stringers. The main ore bodies averaged about 6 percent copper. A few stringers of 10 to 25 percent copper ore, that go into the hanging wall, also were mined.

The lateral workings from the lower adit have been driven along quartz stringers, and along the stronger fractures in shattered and altered limestone. Ore mineralization is confined to veinlets of copper sulfides, ranging from a knife blade to an inch in thickness, that are present at widely scattered places. A little pyrite was noted in the limestone walls of the workings in widely scattered zones.

The examination indicates that the zone favorable to ore mineralization does not extend much beyond the present workings. At the north end of the mine and at a vertical depth of about 50 feet below the adit level the zone encountered barren granite. Conditions also are unfavorable for ore mineralization at the south end of the mine where the degree of alteration and fracturing of the limestone

is less extensive than in the productive zone of the mine.

Copper Duke Mine

The ore at the Copper Duke mine occurs in limestone, and also occurs in granite and rhyolite. All of the ore produced from the mine has come from the underground limestone deposits where it occurred as small lenses with a maximum thickness of probably not over 3 feet (fig. 3). The ore, as azurite, malachite, and a little chrysocalla, contained about 35 percent copper and a little silver. The ore zone dips gently to the west and passes below the workings at the first crosscut from the portal of the adit.

On the surface, the applicant has exposed a mineralized zone that he proposes to mine by open pit methods. There the ore occurs in a fractured zone of granite and rhyolite as blebs and discontinuous veinlets composed of azurite, malachite and a little chrysocalla. The zone has been exposed by a hillside cut and has been sampled by both the applicant and the Reconstruction Finance Corporation. Five samples taken by the applicant averaged 3.7 percent copper. Thirteen samples taken by the Corporation averaged 3.8 percent copper. The mineralized zone has a length of about 80 feet and an average height of about 4 feet.

The examination shows that mineralization in the sampled deposit is spotty and is confined to the most intensly fractured zones. Much of the intervening ground of the samples is essential barren of mineralization and a visual estimate indicates that the

average grade of the zone is less than 3 percent. That the deposit is not extensive is shown by an inspection of the underground workings. Mineralization in the crosscut that explores the deposits at a vertical depth of less than 10 feet is confined to small zones at widely scattered places. It also occurs similarily in the second set of crosscuts and at the granite-quartzite contact. The richer of the mineralized zones may contain as much as 3 percent copper.

ORE RESERVES

Tiptop Mine

The Tiptop mine contains no measured nor indicated ore reserves. It is possible that some ore may remain in the inaccessible portions of the upper workings but there are no data to indicate its presence. It also is possible that other pockets and bunches of ore may be found by following quartz stringers and fractures near the quartzite. However, there is little chance that any substantial tonnage of ore remains in the deposit because of the mode of occurrence, and because only a small part of the favorable zone remains to be explored.

Copper Duke Mine

Past operations have removed all the ore associated with limestone in the zone above the mine workings. It is possible that similar deposits may occur at lower horizons but such deposits would not constitute ore due to the mode of occurrence and their probable limited extent.

The measured and indicated reserves of the surface deposit consist of a few hundred tons of 3.0 to 3.8 percent copper ore. Inferred ore of similar grade may amount to several times the measured and indicated reserves.

PRESENT STATUS

General

The property is inactive. The owner stays on the property, except week-ends, in a 2-room shack that is the only structure.

Exploration

Tiptop Mine

The Tiptop mine is opened by 2 adits and is developed by more than 4,000 feet of underground workings (fig. 2). The workings are distributed principally on 2 levels, about 100 feet apart, vertically. A winze from the lower level is reported to have an inclined length of about 75 feet. A few hundred feet of workings were driven from the bottom of the winze. At present, water stands at the collar of this winze.

Probably all but a few hundred tons of the ore produced from the mine came from stopes above the lower adit level.

Copper Duke Mine

The underground workings of the Copper Duke mine consist of an adit, crosscuts, 2 short raises and 2 stopes (fig. 3). All of the workings except a large part of the stopes are accessible. The stopes from which 400 tons of ore have been produced probably have a maximum height (vein thickness) of about 4 feet.

The surface workings consist of a hillside cut that was sampled by the Reconstruction Finance Corporation in 1947.

Equipment

Mining equipment on the property is confined to an old hoist and skip at the winze of the Tiptop mine.

PROPOSED EXPLORATION AND EXPLOITATION PROGRAM

Exploration

The applicant proposes to drill 10 diamond drill holes on the property at an estimated cost of $10,000. Three of the holes would be drilled at the Copper Duke mine and the remainder would be drilled at the Tiptop mine. The locations from which the applicant proposed to drill the holes are shown on figures 2 and 3. He did not indicate to what depths the holes might be drilled.

Exploitation

The funds requested for this phase of the program would be utilized to purchase equipment and to provide working capital for the purpose of open-pit mining ore at the Copper Duke mine. A loan of $12,870 was requested for this project.

PROPOSED FINANCING

The applicant proposed to repay the loan out of profits from the sale of copper ore that would be produced from the Copper Duke mine. He submitted data showing that 3 percent copper ore would yield an estimated profit of $3.04 a ton. The profit is based on the following data, submitted by the applicant.

Grade of ore - 3 percent, value		$14.70
	Cost a ton*	
Mine and load on trucks	$ 1.00	
Trucking to railroad	2.00	
Freight to smelter	1.56	
Smelting cost	6.50	
Royalty	0.60	
Total cost	11.66	11.66
Net profit per ton before taxes		$ 3.04

* Based on production of 60 tons daily.

CONCLUSIONS

The Tiptop mine contains no measured nor indicated ore reserves. Furthermore, the following findings indicated that the possibilities of finding substantial ore reserves are unfavorable:

1. The ore, both oxides and sulfides of copper, occurred as pockets and bunches in limestone that were confined to a narrow zone near its contact with quartzite;
2. The ore occurred mainly above the lower adit and all of it is believed to have been removed by past mining operations;
3. Little or no ore was found by the lower workings that have rather thoroughly explored the favorable zone;
4. Field evidence indicates the zone favorable to ore deposition is not extensive and that all but a small portion of the zone has been explored by mine workings.

The copper deposits associated with limestone at the Copper Duke mine contain no measured nor indicated ore reserves. These deposits, as lenses of oxide ore, yielded a total of 400 tons from the zone above the adit level. It is possible that other deposits may occur

at lower horizons of the limestone bed but there are no criteria for determining their probable locations. Furthermore, there is no reason to believe that such deposits would be of sufficient extent to be minable under present conditions.

The measured and indicated reserves of the surface-exposed deposit at the Copper Duke mine amount to a few hundred tons of 3.0 to 3.8 percent copper ore. The deposit is cutoff at a depth of a few feet but may extend several tens of feet into the hillside. However, field evidence indicates that the inferred reserves, which may be several times the measured and indicated reserves, consist of lower grade material.

It also is concluded that ore of the grade exposed at the surface cannot be mined at a profit. Open-pit mining of the deposit might yield ore containing as high as 3 percent copper, as estimated by the applicant. Ore of this grade would have a smelter value of $10.75 a ton. Estimated costs a ton would be: $2.00 for mining, $2.00 for trucking, $2.31 for freight, and $4.50 smelting charges, or a total of $10.81. This indicates a loss of $0.06 a ton before royalty and taxes.

RECOMMENDATIONS

It is recommended that the applicant's request for an exploratory loan be denied because the chances of developing any ore at either the Tiptop or Copper Duke mine are unfavorable.

It also is recommended that the request for an exploitation loan be denied because the proposed operation cannot be conducted at a profit.

NOV 13 1951

OFFICE
REGION IV
1951

Hon. Carl Hayden
United States Senate
Washington 25, D. C.

Re: Docket DMA-1019

My dear Senator Hayden:

This is to acknowledge your letter of November 2, 1951 regarding production loan application, DMA-1019, filed by Mr. J. R. Mattingly.

A field examination was made on Mr. Mattingly's property by Defense Minerals Administration, Field Team Region IV, in August 1951. This examination was in the nature of an inspection to determine whether any changes had taken place which would make previous Government data obsolete or necessitate their revision. Since no work was done on the property subsequent to the examination by a competent Reconstruction Finance Corporation field staff in 1947, there was no apparent reason for not accepting their findings for the purposes of this examination. It is felt that the combined investigation of both Government agencies were comprehensive and therefore no further examination of the property is warranted at this time.

The figures of 2700 tons of copper ore is "an analysis of available geological data" as stated in my letter of October 23, 1951. Using the applicant's dimension of his exposed ore body of 125' in length, recalculating his width to 78' instead of 60' and accepting the field team's depth of 4' rather than the applicant's 12', the total volume of ore is 35,000 cubic ft. With 13 tons per cubic foot, the tonnage of copper ore comes to 2,692 tons or rounded off, 2,700 tons. Figuring a 3% mining grade and 90% recovery, 145,800 (146,000 rounded off) pounds of copper can be obtained from this project.

I am enclosing my letter of October 23, 1951 and Mr. Forbes' letter of October 29, 1951 as you requested.

Sincerely yours,

(signed) FRANK E. JOHNSON

Re: Docket No. DMA-1019

My dear Senator Hayden:

This is in acknowledgment and reply to your letter of October 12, 1951 requesting that you be brought up to date on the production loan application of Mr. J. E. Mattingly, DMA-1019.

Since Dr. Boyd's letter of July 30, 1951, Mr. Mattingly's application has been returned from the Defense Minerals Administration Field Team, Region IV and on the basis of their findings Mr. Mattingly was informed with regret that his application was denied.

The denial of this application was based on the findings that 1) the Tip Top mine contains no measured or indicated ore reserves and that geologically it is improbable that additional reserves will be developed and, 2) the surface deposit at the Copper Duke contains only a few hundred tons of ore which is too low in grade to be mined at a profit, and there is no reason to believe that there exist additional deposits of sufficient extent to be minable under present conditions.

In June 1947 Mr. Mattingly applied to the Reconstruction Finance Corporation for a loan of $13,520 to equip the property and provide working capital for surface and underground mining. This application was withdrawn at the suggestion of the Reconstruction Finance Corporation for the reason that without a premium price for copper the operation could not be profitable.

J.F.S.

An analysis of available geological data indicates for an open pit operation a possible potential reserve of approximately 2700 tons of copper ore containing an estimated 3% copper which at present prices would have a smelter value of about $10.75 per ton. Mining, trucking, freight and treatment charges are estimated at $10.81 which indicates a loss of six cents per ton before royalty, taxes, or any capital costs. The total recoverable copper would be only about 73 tons or 146,000 pounds.

A loan of $22,870 would represent a capital expenditure of more than 15 cents per pound of copper and the production cost would be 35 cents per pound before royalty, taxes or any profit to the applicant.

JME
WOM

Mr. Clark

In view of the above analysis, the Defense Minerals Administration believe that the required capital, facilities, manpower and equipment could be better utilized for the Defense Program. The application was therefore denied with regret.

I am returning to you the copy of Dr. Boyd's letter of July 30, 1951 as you requested.

Sincerely yours,

(signed) FRANK E. JOHNSON

Memorandum:

To: Administrative Management Division

From: Director, Supply Division

Subject: Application for Government loan of Mr. James H. Mattingly, 139 Custer, Evanston, Illinois, DPA-1019, Commodity-Copper

Denial of this application is recommended by Field Team Region IV for the following reasons:

1. The ore both oxides and sulfides of copper, occurred as pockets and bunches in limestone that were confined to a narrow zone near its contact with quartzite.

2. The ore occurred mainly above the lower adit and all of it is believed to have been removed by past mining operations.

3. Little or no ore was found by the lower workings that have rather thoroughly explored the favorable zone.

4. Field evidence indicates the zone favorable to ore deposition is not extensive and that all but a small portion of the zone has been explored by mine workings.

5. The ore of the grade explored at the surface cannot be mined at a profit.

A letter has been prepared to the applicant notifying him of this denial.

Transmitted herewith for your disposal is the entire file consisting of the following:

1 DSR-146
1 Field Team Report on the Tip Top Copper Duke Mines with cover letter attached dated Sept. 7, 1951

Files - DMA Docket

Mining Division
Region IV

September 6, 1978

Memorandum

To: DMA Field Team, Region IV

From: Chief, Mining Division, Region IV

Subject: Final Report, Docket DMA-1820, Jos. L. Mattingly, Applicant, Tiptop and Copper Duke Copper Mines, Pima County, Arizona

The application of the subject docket was for a production loan of $22,670 for the purpose of equipping the Copper Duke mine for production at an estimated cost of $12,670, and for the exploration by diamond core drilling of the two deposits at an estimated cost of $10,000.

The mineralization consists of lenses of copper ore in limestone and quartzite near the contact with underlying granite, with some ore in the granite. The Tiptop mine has no measured nor indicated reserves. At the Copper Duke mine, past operations have removed all the ore associated with limestone above the mine workings. The measured and indicated reserves of the surface deposits at the Copper Duke mine consist of a few hundred tons of 3.0 to 3.5 percent copper.

Due to the small tonnage of low grade reserves and the geologic improbability of developing additional reserves, the consulting engineer recommends denial of both the development and exploration loans, which which we concur.

Dear Representative:

I have a copper property in the Heboetia Mining District of Roma County, Arizona which is now under lease to a James R. Mattingly of Evanston, Ill. This forty has applied for a production loan of $22,870. from the Defense Minerals Administration for getting this mine in production again. This property has a production record of former years and can produce again with some government help. I am fully convinced that with this help that the property can produce and also pay off the loan. If there is anything you can do in helping to get this loan I certainly will appreciate it. Loan Application Docket No. DMA-1019.

Best regards.

Very truly yours,

/s/ Denver F. Forbes

To: W. R. Storms (with brochure) (Through Chief, Mining Division)

Charles Anderson

From: DMA Field Team, Region IV

Subject: DMA Docket 1019, James R. Mattingly, Tip Top Group of Mines, Pima County, Arizona

The brochure on the above property has been submitted on RSRB 146 forms and appears to be a request for a direct loan. However, the attached letter from the Commodity Committee indicates that much of the funds requested are for exploration and you should therefore contact the applicant and determine whether or not he is willing and financially able to perform any of the work in a matching fund basis, providing your examination indicates that any exploration is warranted.

JUN 2 1951

Docket: DMA-1019
James R. Mattingly
Tip Top Group of Mines
Copper
Production Loan

Mr. J. H. East, Jr.
Executive Officer, DMA Field Team
Region IV
224 New Customhouse
Denver 2, Colorado

Dear Mr. East:

Enclosed is the application of Mr. James R. Mattingly, 139 Custer, Evanston, Illinois for a production loan of $22,870 for the Tip Top Group of Mines, Pima County, Arizona.

Please arrange to have a field team examine this property for the following purposes

To determine the feasibility of the project.
To determine whether the measured and indicated ore reserves are sufficient to justify the loans.
To check costs of production, transportation and smelting.
To check the correctness of the applicant's ~~nature of~~ expenditures.

If the applicant's mineable ore tonnage does not warrant a loan of $22,870 but should warrant a loan of $12,870 which is the total for expenditures not including the estimated cost of $10,000 for ten diamond drill holes, it could be suggested to the applicant that he arrange to apply for an exploration project for his diamond drilling program. In such a case it would be necessary for the applicant to re-submit his original application reducing the amount of the production loan to $12,870. This proposal, naturally would depend on the findings of the field team.

In the event that your field team should recommend the above stated proposal will you please supply Mr. Mattingly with the necessary forms for filing the applications and all information pertaining to aid for an exploration project.

We would appreciate any further information which your field team may deem necessary or which may assist us in expediting the processing of these applications.

For your convenience we are enclosing the entire file of the application. Please return this application, reports and maps with your report.

Very truly yours,

Tom Lyon

INSTRUCTIONS

Application should be filed with the Department of Commerce, Department of Agriculture, Department of Interior, or the Defense Transport Administration, whichever has the primary interest in the facilities, products, or processes involved. However, for convenience of the applicant, he may file with any government agency with which he has contract or other pertinent relationships and such agency will arrange for the transmittal of the application to the appropriate office.

Submit four (4) signed copies of the application. Name and address of applicant should be stamped or typed for identification of each sheet of the application and all accompanying papers. When a question is inapplicable, this should be so stated on the form. Additional sheets may be attached in answering any questions or in providing other supporting information.

1. PURPOSE OF LOAN

Give a brief general statement of the purpose of the loan requested, including in the table below estimated amounts for such major purposes as land acquisition, building construction, purchase of plant, purchase of equipment, working capital, repayment of debt, etc. Statement should make clear whether funds will be used for expansion of capacity, development of technological processes, or production of essential materials.

General Statement Part of funds, namely $12,870.00 will be used to purchase and install equipment and provide operating capital to start operations on open pit section of Tip Top Copper Mine located 32 miles south of Tucson, Arizona. Accompanying maps, assay certificates, reports, etc. describes the history and development of the property. The property is held by location in the name of Albert Forbes of Tucson, Arizona and under lease to me for a 10-year period. Royalty of 10% of net smelter returns to be paid to Forbes with option to purchase when royalty payments equal $75,000.00. There are fourteen (14) claims in the group. June 18, 1947 application was made to R.F.C. for a mining loan, which was withdrawn when they informed me that no more funds were available for this purpose. The balance of funds requested, namely $10,000.00 would be used (continued on reverse side)

NATURE OF EXPENDITURE	AMOUNT
Construction & Eqpt. cost est. ore bin complete (60-ton capacity).	$ 1,500.00
Portable air compressor	1,600.00
Jack hammers	900.00
Water tank & gas driven pump	350.00
Machine steel, powder, caps & fuses	500.00
Air hose, pipe, values and fittings	500.00
Tugger, cable and sheaves	500.00
Miscellaneous supplies	200.00
(continued on reverse side)	
Total amount applied for	

GENERAL STATEMENT (Continued)

to contract for 10 diamond drill holes to be sunk on several of the claims as indicated on mine map accompanying this application, for the purpose of proving up additional ore and the value of same.

NATURE OF EXPENDITURE (Continued)

	Amount
Construction labor	$ 500.00
Pick up truck (1/2 ton)	2,000.00
Total	$8,550.00
Estimated operating capital	4,320.00
Total	12,870.00
Contract for ten diamond drill holes to be sunk on several of the claims. Approx. amount	10,000.00
GRAND TOTAL	$22,870.00

Estimated Cost of Production Based on 60 Tons per Day.

GRADE OF ORE 3% COPPER - VALUE		$	14.70 per ton
Mine and load on trucks	$ 1.00 per ton		
Trucking to R. R.	2.00 " "		
Freight to smelter	1.56 " "		
Smelting cost	6.50 " "		
Royalty	.60		
Total Cost	$11.66		11.66
Net profit per ton before taxes		$	3.04

Estimated earnings per month based on 26 day Month.

1560 tons per month @ $3.00 per ton profit $4,680.00.
Copper production per month, 81,120 lbs.

2. PROPOSED METHOD FOR REPAYMENT OF LOAN

State sources of funds, and proposed schedule of repayment

Loan repayment to be made out of profits from operation at a rate agreeable to the lending Agency.

3. NATURE OF BUSINESS AND DESCRIPTION OF PROJECT

Describe fully the business activity for which the funds are intended. In so doing, identify the materials and services to be produced, describe the facilities and processes involved, and explain in detail any research activity and the nature of the results expected. Attach blueprints and specifications, if available, and furnish other technical details to the extent that they are not covered elsewhere in the application.

It is planned to quarry copper ore from an open pit, which was uncovered by myself in 1947 and was examined by Walter F. Brown of R.F.C. Phoenix, Arizona office in July, 1947. His map and assays are attached hereto.

Production will be on a basis of 1 car of ore per day to be shipped to the smelter at Hayden, Arizona for treatment. The railroad siding is located 17 miles from the mine. The ore will be trucked by contractors from the mine over a good road to the siding at Sahaurita, Arizona.

4. **Relationship to National Defense.** Explain carefully how the expenditure of the funds will contribute to national defense. As a part of such explanation, the following questions should be answered to the extent possible:

(a) What evidence exists as to current shortages of the materials or services to be produced?

Restriction of civilian use of copper.

(b) What evidence exists as to future shortages of the materials or services to be produced?

Defense needs will probably extend the shortage for some time to come

(c) Are such shortages, if any, regional or national in scope?

It is my opinion a world shortage of copper exists.

(d) In what respects will the use of the funds aid directly in expediting the carrying out of government defense contracts? (A listing of defense contracts, if any, held by applicant is required in item 8 below.)

Use of funds will provide more copper, available for defense needs. I have no defense contracts.

4. Relationship to National Defense - Continued

(e) In what respects will the use of the funds aid indirectly in expediting the carrying out of government defense contracts or related operations?

In making more copper available.

(f) Are there available alternative methods or facilities to accomplish the same purpose as that for which these funds are intended? (For instance, unused capacity, possibility of multiple shift operations, idle facilities, readily convertible equipment, sub-contracting?) If answer is yes, explain why alternatives are not used.

Expansion of capacity by multiple shift operation is possible when funds are available.

5. Maximum Designed Production

List separately materials or services identified in item 3 (a)	Unit of measure (b)	Maximum designed production with existing facilities (c)	Average percentage of maximum designed production used in quarter preceding filing of application (d)	Maximum designed production including use of funds applied for (e)
Mining Copper Ore	60 tons per day	None	None	60 tons per day

6. Employment

(a) Number currently employed at location(s) where funds are to be used. (Use pay period ending nearest 15th of month preceding filing of application.)

None

(b) Maximum feasible employment with existing facilities.

(1) Single shift operation.

None

(2) Multiple shift operation (specify how many shifts).

Two shifts feasible when funds are available.

(c) Estimated additional employees required by the use of the funds applied for.

3 men will be employed plus trucking contractor

7. Timing

(a) On what date(s) are the requested funds needed?

As soon as possible.

(b) On what expected date(s) will applicant begin to use such funds and obtain output from the use of such funds? Wherever possible, give planned schedule of output.

Funds will be used as soon as received and production will start in 30 days on a basis of 60 tons per day.

8. Output from the use of funds applied for will be for the following purposes:

a. For the following principal prime defense contracts (if any) with the United States Government:

Date of contract (a)	Contracting Government Agency (b)	Program symbol (2 digits) or other contract identification (c)	Materials or services (d)	Delivery date(s) (e)	Amount *(Dollars)* (f)
	Have no defense contracts				

b. For the following subcontracts (if any) with U.S. Government prime defense contractors:

Date of contract (a)	Materials or services (b)	Supplied to *(Give name and address of firm)* (c)	Delivery date(s) (d)	(e) Government agency receiving end product or services / (f) Program symbol (2 digits) or other contract identification	Amount *(Dollars)* (g)
				(e) / (f)	
	Have no	subcontracts		(e) / (f)	
				(e) / (f)	

c. For the following classes or types of customers not covered by contracts listed above (list materials or services to be provided and, wherever possible, also indicate final product use):

Ore to be shipped to American Smelting & Refining Co. at Hayden, Arizona.

9. **Feasibility**

(a) Estimate anticipated requirements for manpower, equipment, raw materials, energy, fuel, transportation facilities, water supply, housing, community facilities, and other factors of production, for (1) preparation of the facilities and (2) actual operation thereof. (The estimates may be limited to those factors of substantial significance to the preparation and operation of the facilities for which the funds are intended.)

Men required to be drawn from Helvetia and Sahaurita, Arizona, 2 1/2 and 17 miles respectively from the property. equipment, supplies, etc. as listed on Page 1 - Article 1 from Tucson, Arizona. Fuel (gasoline) obtainable at Sahaurita, Arizona, 17 miles from mine. Pick up truck as listed to be used for general transportation. ore to be trucked on contract. Water supply from shaft on property. Two buildings for housing now on the property, also a blacksmith shop.

(b) Discuss and evaluate the availability of each of the above factors in the area(s) where the funds will be used.

All necessary items available within a distance of 32 miles from the mine. Pick up truck would be purchased in Chicago and driven to Helvetia by myself.

10. The following applications for necessity certificates for tax amortization (Under Section 124A of the Internal Revenue Code) for facilities at the location(s) covered by this application have been filed since January 1, 1950.

Date of application (a)	Government file number (b)	(Estimated) Total of facilities in dollars on each application (c)	(d) If final action has been taken, give date of	
			Issuance	Denial
	No application has been filed			

11. **Recent Efforts to Obtain Credit**

(a) Banks— List names and addresses of all Banks of Deposit of Applicant within the last 5 years: *(Mark with an asterisk (*) bank or banks in which deposits are now kept)*

North Shore National Bank
1737 Howard Street, Chicago, Illinois
Personal checking account

11. **Recent Efforts to Obtain Credit** - Continued

(b) State efforts to obtain credit, within 60 days preceding date of application, from banks, the Reconstruction Finance Corporation, or other sources, results, and reasons if refused. (NOTE.- Section 302 of the Defense Production Act of 1950 states that a loan may be extended "only to the extent that it is not otherwise available on reasonable terms." Accordingly, Applicant should show that it has applied to each bank named in (a) above, or explain the reason for not doing so. The fact that a loan of the particular maturity and terms applied for is refused by a bank or banks is not sufficient to comply with the statute, if credit on reasonable terms is available. State whether a bank will participate in the loan, and if so, state name of bank and amount of participation. Full particulars must be given.) List the names and addresses of banks and other lending institutions to which applications for credit have been made, and in each case state date of application, amount of credit available, if any, maximum term for which credit is available, what consideration, if any, was given to possible guarantee of loan under Federal Reserve Regulation V, and reason for refusal or reason loan was not obtained. Indicate whether or not application was definitely refused for further credit on any basis.

Not eligible for this type of loan from commercial banks. Loan application made to R.F.C. in 1947 as stated on Page 1, Article 1 of this application.

12. What other forms of government financial assistance, if any, have been received or requested by the applicant in connection with the purposes of the loan herein applied for? If applicant plans to request such assistance in the future, give details.

None.

13. **HISTORY, MANAGEMENT, LEASED AGREEMENTS, INSURANCE, ETC.**

These subjects should be fully covered in statements attached hereto. Outline past management experience or other basis for showing competence of the Applicant to perform in accordance with expressed purpose of the application. If plant was purchased, state price, form and terms of payment, date of purchase, from whom and under what circumstances purchase was made. If it is proposed to construct or acquire new facilities (including equipment), state estimated cost and basis of such estimate, form and terms of payment, and from whom purchases of facilities will be made. State whether Applicant, or the business or plant, has been in receivership, bankruptcy, Chapter X, XI or XII, in hands of creditors, committee, or whether Applicant has effected a compromise with creditors, and if so, discuss fully. Indicate whether business is conducted in leased premises and whether any facilities are leased from others and describe terms of any lease agreements. List type and amount of insurance carried on plant property. Describe briefly any pending or threatened litigation affecting Applicant.

13. Applicant is an individual, age 54, single and residing temporarily at 139 Custer, Evanston, Illinois.

Business experience of Applicant:

From 1914 to 1932 - Building construction and maintenance, Chicago, Illinois.

From 1933 to 1950 - Gold placer mining, Bridger, Montana. Gold placer mining, Auburn, California. Copper mining, Golden, New Mexico. Gold silver mining and milling, Pearce, Arizona. Gold mining Arivaca, Arizona. Copper mining Helvetia, Arizona.

Equipment as listed on Page 1, Article 1 will be purchased for cash from Bob Barrett, a mining machinery dealer in Tucson, Arizona. Pick up truck to be purchased from some dealer in Chicago, Illinois. Diamond drilling contract will be let on a basis of open bids of contractors in this area.

Applicant has not been in bankruptcy or receivership. No pending or threatened litigation affecting applicant. The property is under lease to applicant from Albert Forbes of Tucson, Arizona for 10 years, royalty rate 10% of net smelter returns to be applied on option to purchase when payments equal $75,000.00. No insurance carried at present, but will be placed when equipment is purchased.

14. NAMES AND ADDRESSES OF OFFICERS, DIRECTORS, OR PARTNERS, AND IN ADDITION THERETO, THE FIVE LARGEST STOCKHOLDERS IF A CORPORATION.

NAME AND ADDRESS (a)	Official title (If officer is also director indicate by "D") (b)	Total of annual salary, commissions, bonuses, etc., received from Applicant and affiliates during last fiscal year (c)	Estimated net worth outside of Applicant (d)	Number of shares held in applicant		Life insurance carried for benefit of Applicant	
				Common (e)	Preferred (f)	Amount (g)	Net cash surrender value after loans (h)
	N O N E						
	Total		x x x x x			x x x	x x x

15. CAPITAL STOCK ISSUES

For Corporate Applicants

Item	Authorized (a)	Outstanding (b)	Par value (c)	Number of shares outstanding (d)	Dividend rate last paid (e)
Common stock	$	$	$		
Preferred stock	$ N	O N E $	$		

16. PURCHASE AND SALES RELATIONS WITH OTHERS

Does Applicant buy from, sell to, or use the services of, any concern or partnership in which an officer, director, large stockholder, or partner of the Applicant has a substantial interest? If not, so state. If so, give names of such officers, directors, stockholders, and partners, and names of such concerns or partnerships.

N O N E

Does any officer, director, large stockholder, or partner of Applicant receive any commission, bonus, or other payment in cash or services from any concern or partnership with which Applicant has business dealings? If not, so state. If so, give names of such officers, directors, stockholders, or partners and amounts of such commissions, bonuses, or payments.

N O N E

17. COMPENSATION SCHEDULE

INSTRUCTIONS: The schedule shall show the amount of compensation being paid to all employees of Applicant receiving compensation at a rate in excess of $10,000 per annum, including employees paid on a part-time basis where the rate of compensation exceeds $10,000 per annum computed on a full-time basis. If Applicant is a corporation, the schedule should show the compensation, regardless of amount, being paid to all officers, directors, and such stockholders as have an interest in Applicant's business of 10 percent or more. If Applicant is a partnership, the schedule should show the compensation being paid to, or being withdrawn by, all partners for their personal use. If Applicant is an individual, the schedule should show the amount being withdrawn by Applicant for his personal use. In each case the listed person's connection with the business should be indicated (i.e., whether an officer, director, stockholder, partner, owner, etc.). The calendar basis for the compensation should likewise be shown. Attorneys or firms of attorneys on a regular retainer or salary basis should be included. The schedule should include a separate notation indicating the source and amount of any compensation being paid by a company or firm directly or indirectly controlling, affiliated with, or controlled by, Applicant. If the space provided herein is insufficient, the schedule should be continued on the reverse side or appropriate continuation sheets should be attached.

Applicant to manage operation and draw $15.00 per day expenses until smelter returns are received.

17. **COMPENSATION SCHEDULE** - Continued

The term "compensation", as used herein and such schedule, shall include all salaries, fees, bonuses, commissions, retainers, regular drawing accounts, and other payments, direct or indirect, in money or otherwise, for personal services.

Name (a)	Position (b)	Compensation paid during previous fiscal year (c)	Present compensation (d)
JAMES R. MATTINGLY	Owner	None	None

18. **COLLATERAL**

(a) The applicant offers the following described collateral as security for repayment of the loan applied for.

Description (a)	Date acquired (b)	Cost (c)	Book Value (Net) (d)	Appraised* value (e)
Property now held:				
Could give order on smelter for payment from smelter returns.				
None				
To be acquired:				
None				

* This column need be filled in only if a recent appraisal has been made. If so, identify appraiser below.

Name (a)	Title (b)	Date (c)

(b) Describe existing liens, if any, on property listed above.

None.

AGREEMENT AS TO COMPENSATION FOR SERVICES RENDERED OR TO BE RENDERED TO APPLICANT IN CONNECTION WITH APPLICATION AND/OR LOAN

To induce the United States Government and its agencies to make a loan under Sec. 302 of the Defense Production Act of 1950 to JAMES R. MATTINGLY (hereinafter called "Applicant") and in consideration of the making of a loan to Applicant, the undersigned, having been retained by Applicant for the purpose of rendering professional or other services in connection with its application for a loan or loans, hereby represents, warrants, and agrees that the undersigned has not been paid, has not made any agreement with the Applicant to be paid, and has not procured any person to pay or agree to pay, and will not, directly or indirectly, charge or receive any bonus, fee, or commission in any form in connection with the said application for, or the obtaining of, the loan applied for by the Applicant, or any compensation in any form for services rendered or to be rendered in connection therewith except for the services and in the amounts stated below:

Name	Description of services	Amount paid	Amount to be paid
	NONE	$	$

To induce the making of the loan and the employment of the undersigned by Applicant, the undersigned hereby further warrants, covenants and agrees, upon the consideration herein specified, and in consideration of the employment of the undersigned by Applicant, as above recited, that if the amount of compensation stated above for any such services shall not be deemed reasonable by any agency of the United States Government, the undersigned will reduce the charge for such services to such amount as shall be deemed reasonable by such agency, and will not, directly or indirectly, charge or collect from the Applicant or any other person, any sum in excess of the amount so deemed reasonable; and that if the undersigned has heretofore collected, from the Applicant or any other person, as compensation for any such services, any amount deemed by such agency to be unreasonable, the undersigned will refund to Applicant or such other person such sums as are in excess of the amount deemed reasonable. The undersigned further warrants, covenants and agrees that if the amount of the compensation for any such services is not determinable at the date of application, or is not stated above, it will not collect or charge any sum as compensation for such services without the prior written approval of the Government agency with which this application is officially filed as to the nature of the services for which such compensation is to be paid and the amount of such compensation.

Jas. R. Mattingly

Witness: Mary R. Clemente

Address of witness: 1944 West Ohio Street Chicago, Ill.

Dated April 6, 1951

NOTE—Corporations must execute foregoing certificate in corporate name, by duly authorized officer, and seal must be affixed and duly attested; partnerships must execute in firm name, together with signature of a general partner. If no compensation is paid or to be paid for services rendered in connection with application or loan, this should be so stated and the Applicant should sign this Exhibit.

CERTIFICATION

The Applicant hereby certifies that the statements made in the foregoing application, and all exhibits and documents submitted in connection therewith, are true and correct statements to the best of Applicant's information and belief and are submitted as a basis for credit. The Applicant agrees to reimburse any agency of the United States Government upon demand for any expenses incurred in connection with or arising out of this application or any loan made pursuant hereto.

TIP TOP REPORT.

GROUP OF CLAIMS.

LOCATION:

The Tip Top Groupof Claims is located in the foothills of the Santa Rita Mountains, Helvetia Mining District, Pima County, Arizona. It is connected by good wagon roads with Tucson and Vail, on the Southern Pacific RR, being 28 miles S.E. of Tucson, and 15 miles S.W. from Vail. The Tip Top group is joined on the south by the Helvetia group of claims and in the S.W. by the Rosemont group. On the east it adjoins a homestead owned by the Tip Top interests.

AREA AND SURFACE IMPROVEMENTS:

This group comprises one full sizes patented claim, 21 full sized unpatented claims and 7 fractions. The claims cover an area of over 500 acres largely mountainous. Included in this property is a homestead containing 148 acres. One the homestead are seven buildings with four to siz rooms which have been used as dwellings, office, store and assay laboratory. There are also corrals, barns, and valuable water rights on the homestead.

GEOLOGY:

The oldest formation exposed on these claims is a coarsely crystalline granite with very prominent feldspar crystals. Carboniferous limestone forms the only sedimentary upon the granite in this locality. Between the granite and the limestone there is a flat irregular mass of fine-grained quartz porphyry which is found underlying the limestone in the Tip Top hill. In the Copper Duke hill the limestone has been entirely eroded away exposing a large area of this quartz porphyry which has a maximum thickness of two hundred ft. This porphyry is mineralized to some extent with native copper. It assays about 1.5% Cu. with small amounts of silver and gold. Besides this intrusion there have been later intrusions of aplite, mica diotite and quartz monzonite, the latter showing small values in copper. The quartz porphyry was responsible for a large amount of fissuring and faulting and also for ascending mineral solutions. The orebodies in the limestone have formed in the fissures along the contacts of the limestone and porphyry, and the limestone and granite. In the Tip Top claim the main ore chute is a fissure vein, almost vertical, which has been displaced horizontally from 2 to 15 ft. by faulting later than the ore formation. On top of the porphyry this orebody spreads out some distance along the contact. The northern part of this orebody has been faulted to the east and forms what is called the northeast orebody. The footwall of this orebody at the eastern end is the granite, as the quartz porphyry plays out to the east. In the Copper Duke working an orebody was found in a fissure in the porphyry which dipped below the tunnel level at a small angle. On the Mormon Queen and Queen of Sheba fissure veins were found in the porphyry with almost a vertical dip. In the Bull

dozer claim the ore occurs in the limestone near the contact with the granite. The workings on the Noon Day cut a large fault dipping almost vertically and showed quantities of sulphides in the crushed area adjacent to the fault. The dip of the contact of limestone and granite on the Bulldozer claim is at a slight angle to the southwest.

DEVELOPMENT WORK:

The Tip Top claim is the most thoroughly developed claim in the group. It is developed by three levels called the upper main and qinze levels. In the upper level the Big Stone orebody was first discovered and was developed by a drift on the orebody. This orebody has a dip of about 70 degrees to the east. The outcrop of this orebody extended for over 300 ft. but on the upper level was only partially stoped out. The main tunnel on the main level was run south for about 950 ft. and raises were put up about 40 ft. to strike the orebody. The inclined distance between these levels is about 110 ft. and the ore was stoped out to the upper level for about 150 ft. at its northern end. About 6000 tons of ore were shipped to the American S. & R. Co. at El Paso during the years 1904 to 1907. The average of this total shipment was about 6.6% cu., 9 oz. Ag., 27.0% Fe., 25% S., and 35% SiO. This ore being so high in sulphides was smelted for a dollar a ton. The southern part of the orebody has not been mined and is about 350 ft. below the surface at the southern extremity. The northeast orebody has been fully developed on the main level and was about sixty feet long and twenty to forty feet wide.

CLARENCE L. AMEN, E.M.

A raise was put up about 20 ft. in the orebody and showed higher values. On the main level this orebody was greatly broken up but in the raise the ore is more solid and uniform. On the main level the orebody averages about 5.0% cu. and 5 oz. Ag., being similar otherwise to the ore in the Big Stope. In the raise however the ore assayed a little over 6% Cu. and a little higher in silver. To the south of this orebody there is a very large area of limestone mineralized with sulphides, partially developed which assays a little better than 3% cu. Forty below the main level the winze level has partially developed this low grade area showing a little higher values in copper and about $2.00 in gold and silver. In the upper workings there is over 500 ft. of development work, in the main level over 3000 ft. and in the winze level about 350 ft. Between levels there are about 700 ft. of raises, winzes and sub-drifts. In the Copper Duke Claim there has been about 700 ft. of work done. This showed up a vein of malachite varying from one to four feet in width and assaying 15% cu. or better. The vein dipped under the level at a slight degree and into the hill. The ore above the level has been stoped out. On the southeast end of the Copper Duke claim there are two promising outcrops of iron gossan heavily stained with copper which have not been prospected and there are similar ones on the Arctic and Four Aces which have not been developed. A drift was driven on the Mormon Queen on a fissure vein in the porphyry which assayed 7.2% cu. and 0.36 oz. Ag. It is about two feet wide and

seems to be widening out and looking richer. On the Queen of Sheba and Copper Belt there are large areas of copper stained porphyry which indicate other fissure veins in the porphyry. A crosscut is being run to strike this veins about 150 ft. below the surface but at present the crosscut has not been advanced far enough to do this. On the Bulldozer claim the contact of the limestone and granite outcrops and the limestone near the contact has been partly replaced by silica and copper carbonates. Quite a large quantity of this ore has been quarried and still remains on the dumps. To the southeast of the Bulldozer hill, shafts have been put down on this claim and on the America which have cut from 5 to 15 ft. of this oxide ore. An assay of the ore on the Bulldozer dumps assayed 8.8% ct. and 2.96 oz. Ag. Most of the work on this claim was done 15 or 20 years ago and as a result very little is known about was was encountered. It is reported that sulphide ore encountered in the lower workings caused their abandonment, due to the difficulty of smelting sulphide ore at that time. The strike of the limestone and granite is covered by wash to the northwest, so the probable extent of this ore on the Bulldozer is not known. The total amount of development work on the entire group is about 7000 ft.

FUTURE DEVELOPMENT WORK:

The Big Stope orebody to the South narrows to about a foot in width but as that has been the character of the orebody to narrow and then widen out, a drift should be driven South and then raises put up on the vein at about fifty foot intervals. From the length of outcrop to this orebody on the surface, the orebody should continue for from 1 to 100 ft. further South. This Southern extremity would be about 350 ft. below the surface. The northeast orebody on the main level is 200 ft. below the surface and ought to be further developed by raises. The low grade orebody to the south should also be further prospected by raising. An incline shaft would be the most advisable way of further developing the vein of malachite on the Copper Duke claim. The showing on the Bulldozer and America is really the largest on the group and the old shafts ought to be retimbered or new ones sunk to determine the extent of this orebody and the character of the ore in depth. In all the old shafts the ore was cut in considerable quantities as evidenced by the amount on the dumps.

CONCLUSIONS:

The previous method of shipping ore to El Paso cost $5.00 a ton for hauling and freighting; so in order to reduce this cost, some method of reduction or concentration should be adopted. With very little development work, enough additional ore could be blocked out to warrant the erection of a fifty ton smelter. This would be the ideal way of reduction as the character of the different ores is such that an ideal mixture could be gotten. The disadvantage to this method is the distance which the coke and smelter supplies would have to be hauled. In the lower workings of the Tip Top and in the shafts on the Juniper and Bulldozer sufficient water could be gotten for smalter and boiler purposes. A more economical method of treating the sulphide ore would be perhaps to use concentrating tables, roasters

and magnetic separators. This sulphide ore is coarsely crystalline and ought to lend itself very well to this treatment.

The principal disadvantages to this method is the inability to treat the oxide ores in this manner. However this large amount of low grade sulphide ore could hardly be treated economically in the smelter. On the Tip Top dump, there are about two hundred tons of 5.5% sulphide ore and about two thousand tons of sulphide ore better than 3%.

There is a small amount of oxide and sulphide ore on the Noon Day dumps, the oxide assaying about 4% and the sulphide about 3.3% Cu. Taken altogether the ore on the different dumps and that partially developed, there is enough known ore to warrant the furthering of plans for a reduction works.

By the use of a traction engine the hauling charges for coke and mat or concentrates could be greatly reduced.

By either means of reduction a very large per cent of the total costs of handling the ore will be cut out and will admit of a very substantial profit on the ore.

Finally with a small expenditure for reduction works, I am firmly convinced that, even at this present low price of copper the conditions at the property are such that very satisfactory profits may be expected from any money expended in its further progress.

SYNOPSIS OF GEOLOGY OF TIP TOP WORKINGS.
(See Blue Print)

MAIN TUNNEL:

935 ft. long, comprised of 80 ft. of quartz monzonite - 285 ft. or granite, slightly copper stained - 330 ft. of quartzite and 240 ft. of limestone with small stringers of pyrite and chalcopyrite.

1 x: - 285 ft. long, 125 ft. being much shattered quartzite and 160 ft. altered limestone with bunches and stringers of pyrite and chalcopyrite. About 60 ft. of this altered limestone will assay from 2 to 4% copper, at the end of this crosscut there is a small open stope which indicated that further development might be advisable here in the form of an incline raise.

2 x: - 28 ft. long. This crosscut went through quartzite from its entire length.

3 x: - 80 ft. long. This cut 5 ft. of quartzite and 75 ft. of mineralized limestone. At the top of the winze there are bunches of sulphide ore averaging 3 to 8% Cu. This crosscut includes the engine room which is 40 ft. x 15 ft.

4 x: - 135 ft. long. 5 ft. of quartzite, 60 ft. of mineralized limestone averaging about 3.5% Cu. and 70 ft. of altered limestone with stringers of pyrite and chalcopyrite were cut.

5 x: - 75 ft. total length. This crosscut went through altered limestone.

6 x:- 45 ft. long. This cut slightly altered limestone throughout its length.

7 x: - 30 ft. long. Altered limestone with small stringers of pyrite was cut through.

8 X: - 75 ft. long. The material cut was altered limestone, 40 ft. of it being slightly mineralized with chalcopyrite and pyrite.

9 x: - 80 ft. long. Altered limestone with occasional pyrite stringers was crosscut.

10 x: -108 ft. long. This drift penetrated 40 ft. of quartzite, 68 ft. of mineralized limestone averaging 4 to 6% Cu.

11 x: -115 ft. long. This cut through 15 ft. of quartzite, 30 ft. of mineralized limestone, 40 ft. of sulphide ore averaging 4.5% Cu., and 30 ft. of mineralized limestone.

12 x: -65 ft. total length. This advanced through 50 ft. of mineralized limestone and 15 ft. of sulphide ore averaging 5 to 8% Cu.

13 x: - 125 ft. total length. This material cut was 115 ft. of mineralized limestone averaging 3.5% Cu. and 10 ft. of badly broken quartzite.

14 x: - 30 ft. in length. This cut 30 ft. of mineralized limestone assaying 3.5% Cu.

15 x: - 105 ft. long. The total advance shows 55 ft. of mineralized limestone going 3.5% Cu., and 50 ft. of altered limestone.

16 x: - 80 ft. long. For its total length it contained altered limestone slightly mineralized.

17 x: - 15 ft. total advance. 10 ft. was mineralized limestone and 5 ft. of much altered granite.

18 x: - 15 ft. long. This cut 10 ft. of mineralized limestone and 5 ft. of sulphide ore averaging 4% Cu.

19 x: - 60 ft. long. This cut sulphide ore averaging 5.5% Cu. through its entire length.

20 x: - 14 ft. long, 12 ft. of sulphide ore going 5% Cu. was shown and 3 ft. of mineralized limestone.

21 x: - 12 ft. in length. This cut sulphide ore carrying 5% Cu. throughout its length.

22 x: - 15 ft. long. This cut mineralized limestone.

23 x: - 25 ft. long. This cut mineralized limestone.

24 x: - 15 ft. long. The advance shows 15 ft. of mineralized limestone.

25 x: - 15 ft. in length. Mineralized limestone showing 3% Cu. was cut.

26 x: - 20 ft. long. The material passed through was altered limestone, showing stringers of pyrite.

27 x: - 15 ft. long. This showed limestone throughout.

28 x: - 15 ft. advance. This was driven in altered limestone slightly mineralized.

29 x: - 15 ft. long. This showed mineralized limestone averaging 3.5% Cu.

30 x: - 35 ft. long. This exposed bunches of sulphide ore averaging 3% to 8% Cu. in an altered limestone.

Note pertaining to sulphide ore in 19x, 20x, 21x and 11x. The ore is bunchy and if a little care be taken in sorting the ore assays as high as 8% and 9% will be gotten.

#1 Winze: - 40 ft. vertically, 65 ft. on incline: - this shows 15 ft. of bunchy sulphide ore averaging 6 to 8% Cu., 10 ft. of very much altered limestone or quartzite and 15 ft. of granite.

#2 Winze: - 40 ft. vertically. This shows mineralized limestone going 3 to 3½% Cu. for 20 ft. and altered limestone and quartzite, the other 20 ft.

Winze x cut --- 125 ft. long. This cut granite in its entire length. #1

Winze x cut --- 180 ft. long. This crosscut 20 ft. of granite 140 ft. of badly broken quartzite and 20 ft. of altered limestone with small bunches and stringers of pyrite and chalcopyrite.

C O P Y

Tucson, A. T. August 6th, 1906

Mr. H. R. Simpson,

Asst. Gen'l Manager

A. S. & R. Co.

U. E. MATTINGLY
139 CUSTER
EVANSTON, ILL.

No. 10

Dear Sir:

I beg to submit herewith condensed report, showing measurements of ore bodies, map, shipments of ore and values of same on the Tip Top Mines, located in Helvetia Mining Camp, Pima County, Arizona, sixteen miles Southwest by wagon road from Vails Station on the S. R. R. R.

1. Property consists of 31 mining claims, dimensions 1500' x 600'.
2. One patented claim and 30 held by right of possession: all work holding same regularly complied with in accordance with the mining laws of the District and the United States.
3. DEVELOPMENT WORK consists of some 7,000 feet of levels, drifts, raises and winzes. Trend of vein and ore bodies Northwest and Southeast.
4. DIP OF VEIN and ore bodies South of West, standing nearly vertical.
5. HANGING WALL side of vein, Country rock, quartzite.
6. FOOT WALL side of vein, Country rock, Granite.
7. VEIN OR DYKE appears to be an altered porphyry with lime and shale disturbances, bounded on the Northeast by the granite and Southwest by quartzite.

8. CHARACTER OF SURFACE ORES in shallow workings, silicious carbonates, malachites and azurites.

9. CHARACTER OF SMELTING ORES sulphides, yellow copper, chalcopyrite and bornite.

10. CHARACTER OF CONCENTRATING ORES, silicious sulphides.

11. AVAILABLE SMELTING ORES in Tip Top Claim estimated at 25,000 tons: Assays _____oz., au., _____oz.ag. _____ 6.5% cu.

12. AVAILABLE CONCENTRATING ORES in Tip Top Mine - estimated dimensions 400' x 100' - allowing 15 cu. Ft. to the ton - would yield 373,000 tons: average assay _____oz. au. _____ _____oz. ag. 2.1% cu. wet.

13. COST OF MINING SMELTING ORES, $1.50 per ton.

14. COST OF WAGON HAUL SMELTING ORES, mine to Vail, $2.50 per ton.

15. COST OF MINING CONCENTRATING ORES, $1.00 per ton.

16. COST OF MILLING AND concentrating ores locally (approximately) $.60 per ton.

17. TOTAL SHIPMENTS to Smelter, El Paso, 310 Cars.

18. TOTAL SULPHIDE SMELTING ORE SHIPMENTS, 9,300 tons.

19. TOTAL NET SMELTER RETURNS on sulphide shipments, $93,000.00.

20. TOTAL NET MINE RETURN on sulphide smelting ores, $55,000.00.

21. NET AVAILABLE SULPHIDE smelting ores in mine, value $150,000.00.

22. NET AVAILABLE CONCENTRATING ORES in mine, value $373,000.00.

23. NET VALUE PER TON at mines, smelting ores, as per past shipments, $6.00 per ton.

24. NET VALUE PER TON estimated on raw concentrating ore, 2.5 cu., $1.00 per ton in mine.

Mine has been self supporting under frightful disadvantages.

I can see no reason, from all the facts presented, why the Tip Top Mine cannot be made one of the very good copper producing properties of Arizona. It certainly has the good features and ear marks of a good pay copper sulphide zone.

I unhesitatingly recommend it to our company.

Yours truly,

Douglas Gray
Ore Purchasing Agent.

and

DESCRIPTION OF SAMPLES

KEY TO MAP AND DESCRIPTION OF SAMPLES

All numbers in red ink shown on Map of plan "A".

* * * * * *

Sample #1 - Big stope above tunnel level from which May and June shipments were made.

#2 - Big stope extension, South ore chute, shipments made to smelter from this point in May and June.

#3 - North drift under North stope winze (30 mine cars taken from this point). Shipments made to Smelter from this point in May, June and July.

#4 - Southeast Slip, shipping ore, 25 mine cars taken out of this winze and raise.

#5 - West Drift, 25 mine cars taken from this place, 900 ft. from mouth of tunnel, 300 ft. deep, and put in smelter shipments.

#6 - Big Stope, July shipments.

#7 - Upper workings and stope in the main raise. This sample represents grade and character of the good ore mined above, and went in recent smelter shipments.

#8 - From No. 6 Raise, ore shipped to smelter from this point in July.

#9 - From winze, shipment from this point put in July smelter shipments.

#10- Silver streak, 400 ft. from mouth of tunnel - a very promising point for a productive ore chute. No ore from this point ever shipped and is in an undeveloped part of mine.

#11 - Special sample winze, below tunnel 20'.

#12 - Special sample out of raise above tunnel level, and in strong and good smelting ore.

#xx - Represents native copper in the quartz and shale. Tonnage not estimated or considered.

#xxx- Represents a series of samples taken, selected sulphide ores along the course of tunnel, 700 ft. from mouth. Nos. A, B, C, D, E, F, G and H. Low grade concentrating ore on tunnel level, single block.

"I" - Represents 6,000 tons dump ore, low grade concentrating sulphides.

"J" - Represents 4,000 tons low grade sulphides on waste dumps - Could be concentrated.

* * * * * *

FOR REFERENCE.

0. - Granite foot wall.
00. - Quartzite Hanging Wall.
000. - Shales or vein matter.
0000. - Black lime with manganese, occurs as a disturbing element in vein as horse at times.
00000. - Lime vein capping on mountainside.

Dear Mr. Maurice:

This will acknowledge your letter with reference to government mining loan applications.

We are enclosing a copy of a press release, dated December 5, describing the type of assistance that can be given, and an outline indicating the type of information you should furnish with your application.

We do not have copies of MMRB 146 available at this time, but will forward five copies to you as soon as a supply is received. You should forward four copies of the application form to this office or to Dr. James Boyd, Administrator, Defense Minerals Administration, Interior Building, Washington 25, D. C.

Sincerely yours,

J. H. East, Jr.
Regional Director
