Re: New application (Tungsten)
New York Mining Company, Inc.
New York Mines
Idaho County, Idaho

Dear Mr. Selfridge:

Enclosed are three copies of an application for aid to explore for tungsten at the New York Mines also known as the Shamrock Group of claims in the Ten Mile Mining District, Idaho County, Idaho.

This application was delivered to the Spokane Survey Office personally by Mr. Gus Darland, manager of the New York Mining Company. In reviewing the application with Mr. Darland, it was pointed out that the amount of the proposed trenching appeared to be so excessive as to border in part on prospecting; that his cost estimates were neither summarized nor totalled; and that no mention was made of the qualifications of the person to be in charge. Mr. Darland promised to send us a statement on the qualifications of their superintendent.

As a field examination will have to be made to determine whether or not a program could be approved, the application was accepted in its present form. When the property is examined, the fieldmen can discuss possible alternative programs with the company's representatives in the field and can straighten out the presently confused cost estimate if a program is to be recommended.

INSTRUCTIONS

1. *Name of applicant.*—(*a*) State here your full legal name, in the form in which you will wish to contract, and your mailing address: NEW YORK MINING COMPANY, INC.
Dr. John Patterson, Pres., Stuenberg Bldg., Caldwell, Idaho
Gus Darland, 412 Diamond, Nampa, Idaho (Business Mgr.)
W. E. Price, Sec., Box 488, Nampa, Idaho

(*b*) If other than an individual, add to your name above whether a corporation, partnership, etc., and the name of the State in which incorporated or otherwise organized.

(*c*) If a corporation, add to above statement, titles, names and addresses of officers.

(*d*) If a partnership, add to the above statement the names and addresses of all partners.

2. *General.*—Read DMEA Order 1, "Government Aid in Defense Exploration Projects," before completing this application. Submit this application and all accompanying papers in quadruplicate (four copies), with your name and address on each sheet of the application and on all accompanying papers. Where sufficient space is not provided on the form for all required information, state it on an accompanying paper, with a reference in each case to the instruction to which it refers by number. Comply with all applicable instructions; or, if not applicable, so state. File the application with Defense Minerals Exploration Administration, Department of the Interior, Washington 25, D. C., or with the nearest field executive officer thereof.

3. *Applicant's property rights.*—(*a*) State the legal description of the land upon which you wish to explore, including all land which you possess or control that may be benefited by the exploration, and excluding any land or interest in land which is not to be included in the exploration project contract
See Maps attached

(*b*) State any mine name by which the property is known. NEW YORK MINES

(*c*) State your interest in the land, whether owner, lessee, purchaser under contract, or otherwise
Purchase Agreement (attached)

(*d*) If you are not the owner, submit with this application a copy of the lease, contract, or other document under which you control the property. Purchase Agreement Attached

(*e*) If you own the land, describe any liens or encumbrances on it
Purchase agreement only

(*f*) If the land consists of unpatented claims, add to the description above, the book and page numbers for each recorded location notice. list attached

4. *Physical description.*—(*a*) Describe in detail any mining or exploration operations which have been or now are being conducted upon the land, including existing mine workings and production facilities. State your interest, if any, in such operations. Also describe accessibility of mine workings for examination purposes. Ex 6-D item 4th

(*b*) State past and current production, and ore reserves, if any, giving quantities and grades. Eng report Al Lynch attached

(*c*) Describe the geologic features of the property, including mineralization, type of deposit (vein, bedded, etc.), and your reasons for wishing to explore. Illustrate with maps or sketches. Send with your application (but not necessarily as a part of it) any geologic or engineering report, assay maps, or other technologic information you may have, indicating on each whether you require its return to you. Blaine Hanks, Al Lynch + Sheenan + Reed, reports,

(*d*) State the facts with respect to the accessibility of the project: Access roads, distances to shipping, supply and residence points. Al Lynch, report

(*e*) State the availability of manpower, materials, supplies, equipment, water, and power.
All available at Property.

16—66551-1

5. *The exploration project.*—(*a*) State the mineral or minerals for which you wish to explore TUNGSTEN

(*b*) Describe fully the proposed work, including a map or sketch of the property showing a plan (and cross sections if needed) of any present mine workings, and the location of the proposed exploration work as related to such features as contacts, veins, ore-bearing beds, etc.

(*c*) The work will start within 90 days and be completed within 24 months from the date of an exploration project contract.

(*d*) State the operating experience and background of the applicant with relation to the ability to carry out such exploration project, and also that of the person or persons who will supervise the operations.

6. *Estimate of costs.*—Furnish a detailed estimate of the costs of the proposed work (you will have to use a separate sheet), under the following headings. Add the totals under all headings to give the estimated total cost of the project:

(*a*) *Independent contracts.*—(Note.—If the applicant does not intend to let any of the work to contractors, write "none" after this item. To the extent that the work is to be contracted, do not repeat the cost of the contract-work in subsequent items.) State the cost of any proposed independent contracts for the performance of all or any part of the work, expressed in terms of units of work (such as per foot of drilling, per foot of drifting, per hour of bulldozer operations, per cubic yard of material moved, etc.). NONE

(*b*) *Labor, supervision, consultants.*—Include an itemized schedule of numbers, classes and rates of wages, salaries or fees for necessary labor, supervision and engineering and geological consultants.

(*c*) *Operating materials and supplies.*—Furnish an itemized list, including items of equipment costing less than $50 each, and power, water and fuel.

(*d*) *Operating equipment.*—Furnish an itemized list of any operating equipment to be rented, purchased, or which is owned and will be furnished by the Operator, with the estimated rental, purchase price, or suggested use-allowance based on present value, as the case may be.

(*e*) *Rehabilitation and repairs.*—Furnish a detailed list showing the cost of any necessary initial rehabilitation or repairs of existing buildings, installations, fixtures, and movable operating equipment, now owned by the Operator and which will be devoted to the exploration project.

(*f*) *New buildings, improvements, installations.*—Furnish a detailed list showing the cost of any necessary buildings, fixed improvements, or installations to be purchased, installed or constructed for the benefit of the exploration project.

(*g*) *Miscellaneous.*—Furnish a detailed list showing the cost of repairs to and maintenance of operating equipment (not including initial rehabilitation or repairs of the Operator's equipment), analytical work, accounting, workmen's compensation and employers' liability insurance, and payroll taxes.

(*h*) *Contingencies.*—Give an estimate of any necessary allowances for contingencies not included in the costs stated above.

NOTE.—No items of general overhead, corporate management, interest, taxes (other than payroll and sales taxes), or any other indirect costs, or work performed or costs incurred before the date of the contract, should be included in the estimate of costs.

7. (*a*) Are you prepared to furnish your share of the cost of the proposed project in accordance with the regulations on Government participation (Sec. 7, DMEA No. 1)? YES

(*b*) How do you propose to furnish your share of the costs?

[X] Money [X] Use of equipment owned by you [ ] Other

Explain in detail on acompanying paper. Complete Camp & Equipment except items listed in Exhibits 6B + 6F

CERTIFICATION

The undersigned, whether as an individual, corporate officer, partner, or otherwise, both in his own behalf and acting for the applicant, certifies that the information set forth in this form and accompanying papers is correct and complete, to the best of his knowledge and belief.

1-Operating equipment -- rented, purchased, or owned.

Deisel HD - 7 - Cat Bull Dozer W - 100.00 per day, including cat operator and helper, all repairs and fuel - 8 hours--20 days on open cuts @ 100.00 per day.

Total $2000.00

Compressor and tugger, 1 year @ 350.00 per month, including all repairs and hose for open cuts and under-ground operations. . . $4200.00

2-Bull Dozer opening up adits for escape, air working entry. 100.00 per day for 6 days..... $600.00.

Rental on Jack Hamer's drifters and steel - 100.00 per month, 12 months - $1200.00

Use of 4-wheel Drive Truck for 1 year @ 100.00 per month - 1200.00

Use of 4-wheel drive jeep @ 50.00 per month - 600.00.

Use of welding and cutting equipment, including blacksmith shop tools, and [redacted] - @ 25.00 per month, for 1 year - $300.00.

Use of new Home lite power timber saw, 20.00 per month, 1 year - wood and timber also Clearing ahead of Dozer - 240.00.

[redacted]. includes labor, repairs, and fuel. Not powder caps or fuse.

3-bull Dozer operations on open cuts, on account of steep terrain, and heavy timber and underbrush. Will also require some blasting in cliffs and rocks, 300 ft. per day - 20 days, @ $100.00 per day. Includes supervision cat. operator and helper. These cuts shown on claim map, are to expose scheelite on surface above where we have found float and some in open cut in place, as shown on map. 20 days @ $100.00 per day - $2000.00. This does not include powder and caps and fuse which comes under Misc.

4-Bull Dozer operations for 6 days @ 100.00 per day opening up adits #'s 3, 4, 5, 6, 7, & # 11. Includes all labor and fuel. No powder, caps, nor fuse. Opening these adits, gives good access to operations for exploration and escape. Also good clean air. Some stopes above #5 tunnel adit are narrow and require crawling on stomach's to get through. So by opening these adits which are caved at face, will give us good access to all operations and exploring, From the outside, without crawling up from inside, tunnel #'s start at bottom, # goes up to #-11 @ top.

5-compressor and equipment @ 350.00 per month. Includes attendant and hose slusher and air hoist.

6-300 ft. of raises, includes all labor, timber, powder, fuse, caps. Size 4 x 12 @ $55.00 per ft. - $14500.00.
1st raise as shown on map at jct. on main #1 level, 1st scheelite shown
2nd raise at south end of New York vein in main tunnel

7-300 ft. of latteral drifting @ 31.00 per ft. 5' x 7' $9300.00. Includes all labor, timber, powder, fuse, and caps.

These short drifts on vein are to determine latteral extension's of scheelite vein showing in raises.

8-250 ft. cross cuts, 5 x 7, to tap scheelite, showing in place between and below present level 31.00 per ft. Includes labor, timber, powder, fuse, and caps. $7750.00

This cross cut would also cut across dyke at lower depth, where scheelite shows up also underneath where float shows up on surface in several places, which is explained in letter attached hereto.

6E - Continued.

10-½" couplings	15¢	1.50
20-½" T's	27¢	5.40

DEFENS[illegible]INERALS EXPLORATION ADM.

Spokane, Washington Washington D.C.

Exhibit

#1 RAISE: To explore a strong showing of Scheelite occuring in the footwall of the New York vein about 70 feet from where vein is tapped by Cross-cut in #1 tunnel. This showing may prove to be an extensive ore body, as it occurs in a fault whose plane is Northeast-Southwest, and which intersects the New York vein about 40 feet South of where stopping operations were started at the South end. At that point, a short cross-cut was run in the footwall for an ore pocket. This crosscut exposes several strata of scheelite which appear to run parallel to the New York vein, at that point. From that point Northward, the footwall has not been tapped in #1 tunnel.

#2 RAISE: Another showing of scheelite occurs in #1 tunnel in dike material where the New York vein is intersected by what engineers pronounce to be a post-mineral dike.

Supposition: A body of scheelite ore lays beneath, and running approximately parallel to the New York vein, from proposed site of #1 raise to #2. #1 Raise would be in footwall material - #2 Raise would be in dike material. Briefly stated, this theory is based on the assumption that main tungsten values occur on the footwall side of the New York south of the post-mineral dike, and on the hanging wall side northward from that point. That theory is substantiated by surface indications in these respects: (1) Scheelite float occurs on the surface, near the uppermost workings of the New York vein (#11). At a lower elevation and eastward from that point, the formation is cut by a road running east and west. In the vicinity of the apex of the New York vein the overburden is deep, but eastward the formation is hard and is exposed by the road. At a point 3 or 400 feet easterly of the apex, a hard highly mineralized strata, under the blacklight shows minute particles that fluoresce a yellow or golden color. The formation changes to a gneissoid structure to the east of that strata. Small pockets of pure scheelite have been found in that and bulldozer operations above that point, have exposed float carrying scheelite values. Any of this formation, when panned, shows a long tail of heavy mineral that fluoresces as powellite, and down the hill near creek level in a southwesterly direction from that point, there are scheelite indications.

The topography affords an excellent opportunity to explore the extent of tungsten values on the hanging wall side of the New York vein, by means of a crosscut. The crosscut would begin at a point that is easterly from, and at a lower elevation than the adit of #1 tunnel and driven in a northwesterly direction.

Such an operation would permit exploration of a scope of ground whose surface indications are favorable towards such a crosscut exposing an extensive body of tungsten ore of considerable length and breadth. As concerns depth, the tungsten showing in the New York ledge itself, serves as proof that tungsten values in that area can be expected to be deep seated, for the lowest tunnel in the New York workings shows the continuation of scheelite at several places in the bottom of the drift.

NEW YORK MINING CO., INC.

Fall Creek Station, Golden, Idaho

LOCATION

A

4-A The property is located in the northern part of Idaho County, of which Grangeville is the County Seat, and also the nearest railroad shipping point. It is the Ten Mile Mining District, near the head of Fall Creek in Section 24, Township 27 N., Range 7, E.B.M.

4-D The all year highway from Grangeville to Elk City affords excellent transportation facilities to Fall Creek Station, from which point the property is reached by a private road. (5 miles) Highway distance from the mine to Grangeville is 35 miles; to Elk City 15 miles.

DESCRIPTION OF CLAIMS

B

The property consists of 14 Quartz Mining Claims covering about 280 acres, known as the Shamrock group, and so named because of the pattern in which they are situated.

TITLE

C

Title was acquired by H. W. White by making valid Quartz Mining Locations on the Shamrock group in 1931. Title has been maintained to the present date by complying with all State and Federal mining regulations since date of location, and by keeping the property free of liens and other encumbrances. On June 17, of 1955, a partnership, consisting of W. C. Randolph, R. O. Randolph, W. H. Baxter, Herbert Hartwell, Gus D. Darland, and A. J. Lynch, entered into a Purchase Agreement with H. W. White and Helen White, whereby H. W. White and Helen White, agreed to sell to the partnership, the Shamrock Group of mining claims and title to the claims was placed in escrow in the First Security Bank of Grangeville, Idaho pending fulfillment by the partnership of the terms of the Purchase Agreement. On October 12, 1955, the partnership, W. O. Randolph, R. O. Randolph, W. H. Baxter,

Herbert Hartwell, Gus D. Darland and A. J. Lynch, sold to the New York Mining Company, Inc., all rights and interests held by them in the Shamrock Group of mining claims, along with all mining, milling, and other equipment owned by them, on the property at the time of sale.

D. TERMS

New York Mining Company, Inc., paid W. O. Randolph, R. O. Randolph, W. H. Baxter, Herbert Hartwell, Gus D. Darland and A. J. Lynch the total sum of $35,500 in stock (325,000 shares) and a total cash payment of $3,500 in the form of 90 day notes, [redacted] after completing the payments to H. W. and Helen White on Purchase Agreement, the balance of which is assumed by the New York Mining Company, Inc.

Amount and Terms of Payments due H. W. and Helen White

H. W. White and Helen White will receive 10% royalty on all metals or minerals recovered, (said payments to be based on Mint or Smelter receipts) until the balance of $49,500 has been paid them. They are to receive a minimum payment of $1,500 a year in 3 payments of $500, all payments to apply to purchase price. Title to the Shamrock Group will be delivered to the New York Mining Company, Inc., when the balance of $49,500 has been paid to H. W. and Helen White. All Deeds, Bills of Sale and other contracts pertaining to the transactions are in escrow in The First Security Bank of Grangeville, Idaho.

E Nature of Mineral Deposits

The known valuable minerals are in lode form and are chiefly, gold and tungsten. The gold occurs both in a free milling state and as a base ore. The tungsten values are in the form of Scheelite, which is one of the two most important ores of tungsten.

F. History

The property has never been worked for anything but its gold values and for the most part, all of the exploration, development and production, has been confined to the original New York Claim, located by

Fred and Charles Smith, in 1909.

Authentic production records are not available prior to 1934, but estimates of total production up to that year are $394,000. The mine has not been on actual production since last operated by H. W. White, whose records show that from 1934 to 1937 he milled 2,396.58 tons of ore, from which he recovered $62,597.97, an average of $25.975 per ton. His last shipment was to the smelter in 1938. Settlement sheet for the mixed shipment of crude ore and concentrates, shows a total weight of 48.262 tons, having an average gold content of 2.345 fine ounces and 1.688 fine ounces of silver per ton, for which the gross settlement was $3,219.18.

By examining the character of the ore and the milling methods used, and by actual records, engineers state that the average recovery of gold values could not have exceeded 65% of the total. White operated profitably in spite of that loss as well as not recovering any tungsten values, and did not stop operations for lack of ore but because of ill health.

C. Development

Past records show a total development on the Shamrock group to be 3,625 feet, 2915 of which are drifts and crosscuts, and 710 feet of raises and no shafts. With the exception of about 200 feet of crosscut in the original "Georgia" claim and about 200 feet of crosscut in the original "Mississippi" all of the work was done on the New York claim. The strike of the New York ledge is almost North-South and the dip is Easterly at from 25° to 45°. The ledge is intersected on the North by a dike and is on the north side of Fall Creek Canyon which at that point runs East-West. These topographic features largely account for methods used in past mining operations, for there is a total of 11 tunnels in the hillside in a distance of not more than 600 feet on the surface, from the apex to the lowest tunnel. The portals at least, of the oldest tunnel are caved but the lower one (through which all operations of extracting the ore from above will be conducted) is well con-

creted at the portal and is in excellent condition throughout.

H. EQUIPMENT AND IMPROVEMENTS

The mine is equipped with a good track the full lenth of the lower tunnel as well as a track to the mill and waste deump, and there are two ore cars. There is air line from the portal to within 40 feet of the face--also some air line extending into the stopes and there are two air receivers--one in the mine and one at the portal and also pressure tanks for drilling water. There are two drilling machines (heavy jackhammers) and some miscellaneous drill steel.

I.

Additional equipment to the mill since the mine was on production, includes a 50 ton ball mill, which replaces the 5 stamp mill used by White. A 110 H.P. Deisel-electric power plant, which replaces the Felton Water Wheel that was White's sole source of power for milling operations. The water power system is still intact and can be used to run the generator during the spring and early summer months by shifting the driving helt from deisel engine to the Felton Wheel pulley. Also included in additional equipment to the mill, is a 75 ton Sub-A flotation cell, which will be needed for efficient recovery of gold values from base ore as well as recovery of tungsten values.

Pelton?

Building improvements include a 24 x 36 repair shop with a concrete floor with a built-in track and Blacksmith shop with forges, anvils and tools, a 30 x 40 bunkhouse with concrete floor and smaller building 14 x 20 originally planned for an assay office, but is being used as cook house at present time.

J. PRESENT PLANS

Milling

As concerns milling, present plans are to rehabilitate the mill and install what additional equipment that will be required to effect an efficient recovery of gold and tungsten values.

K. Mining

The general status of the lower working would permit almost immediate

production. Tunnel repairs will consist chiefly, of minor track repairs, installation of chute sets for a new chute from which to open a new stope on the north end of the ledge and one on the south end. From those points, stoping operations will be started as soon as the mill is ready to handle ore. Where high tungsten values occur, the stopes will be widened to exploit the ore, but where gold values predominate, stoping in the end stopes will be conducted primarily for the purpose of using them for ore passages from the uppermost workings. For that reason proper alignment and sufficient width to accomodate slusher operations to good advantage, will determine the width of the stopes rather than the extent of ore being the determining factor. When this is accomplished, the pitch of the ledge, in conjunction with the general character of the hanging wall will permit beginning at the top, the removal of all ore left in past operations without creating a hazard on lower levels. This system will provide comparatively cheap tonnage and should offset the much lower material and labor costs enjoyed by past operators. Higher efficienty of general mill operation and particularly grinding, should make the total cost per ton of ore treated, less than in 1938. The fact that tungsten values occur in the same vein matter as gold, as well as a higher gold recovery in milling operations, will have an important bearing on what constitutes profitable ore, as compared with metal prices and mining and milling practices in all previous operations of the property. Considering these factors, sufficient tonnage should be derived from the old workings to supply milling ore for an ample period of time in which to carry on exploration and development work. Present intentions are to conduct exploration work in, or about the lower tunnel rather than to tap the New York ledge at a lower depth. Present metal prices as well as future outlook, serve to dictate the exploitation of ore bodies where tungsten values predominate and hold the gold ore bodies in reserve for future and larger operations at lower depths.

A strong showing of scheelite occurring in the lower tunnel and con-

siderable distance into the footwall from the New York ledge, offers good possibilities of developing into a sizeable orebody. Another showing of sheelite occurs to the north of the New York ledge in the lower tunnel. This showing is in the dike material and both will receive immediate attention as soon as exploration work is started. Also in the exploration program is the continuation of the lower tunnel, for two purposes; 1. (to pick up the north part of the New York ledge, for past engineers' reports pronounce the dike as post mineral and stated a good possibility of there being a continuation of the New York ledge on the north side of the dike;) 2. After examining the property in 1938, A. G. Kirby reported that by driving north, a distance of 500 feet from the face of the lower tunnel, an East-West lead he named the "Ontario", would be tapped and pronounced it to be one of the strongest leads in the district. Since then bulldozer operations on the surface, northeast of that point have exposed a strong easterly-westerly lead, and if Kirby was correct both as to continuation and distance, that orebody could be tapped by driving 365 feet from the present face of the lower tunnel. In that event there would be a distance of at least 600 feet to the surface and an orebody that has never been exploited or explored.

-- CONCLUSION--

In conclusion to this paper the evidence past and present shows great milling and mining possibilities and that we have a good tonnage of tungsten (ore of scheelite) and gold plus some silver in the present vein system to commence milling as soon as proper milling equipment can be installed and that the New York Holdings will give good returns from present development.

I consider Mr Lynch report very factual and the result of a great deal of study and experience on the Ground — B Hawkes

REPORT ON NEW YORK MINE-SHAMROCK GROUP

This is a report on the New York Mine-Shamrock Group of fourteen mining claims, full description of which is given on the following pages.

The New York Mine constitutes a small area of large mineralization and is practically the only development on the fourteen claims of any consequence.

I have placed in the back of this report all of the detailed information I was able to find in the short time at the mine. This examination was decidely limited as to time. We left Boise at four o'clock Sunday morning, and reached Fall Creek below the mine at 11:oo A.M. The dozers had not completed the road into the mine and we left Monday morning to try and make the trip, arriving in the New York tunnel in the afternoon. On Tuesday morning we went underground and spent the day there, and Wednesday morning, and Wednesday afternoon were notified we were leaving that afternoon, and returned that day to Grangeville and the next day to Boise, Thursday.

It was understood before leaving here that this report was entirely preliminary; snow conditions and the time element and the weather made it necessary that it would be very short. Only the New York adit was accessible with six to eight feet of snow all over everywhere and no dumps or surface showing of any kind. The New York mine has eleven levels, and they are numbered from the bottom up, which reverses the usual order, starting with No. 1 below. They are presumably fifty feet apart, all on the incline of the vein and driven through ore the entire distance to the surface. The veritable distance from the surface to the number 11 level is said tobe 430 feet. I reached the point where No. 3 was supposed to be; the ladders and ropes had rotted out and the upper workings were not available. A few samples were taken,

eight in all. These were merely indicative of the ore left in former operations, and the fill which is left in the mine is reported to be around eighteen thousand tons. The sample were also analyzed for tungsten as the blackbite showed considerable tungsten in the veins.

Sample No. 1, gold value 8.40; tungsten .03%
Sample No. 2, gold value 2.80, tungsten .06%
Sample No. 3, gold value 2.10; tungsten .05%
Sample No. 4, gold value 2.80; tungsten .07%
Sample No. 5, gold value 2.80; tungsten trace
Sample No. 6, gold value 1.40; silver .80; tungsten .02%
Sample No. 7, gold value 1.40; tungsten .18%
Sample No. 8, gold value 50.40; silver 2.30; tungsten .66%

No. 1 sample is grab taken on the floor of the runways and old stopes.

No. 2, 30" wide of quartz, between Levels 2 and 3.

No. 3, ore left from previous operations between stopes three feet in width.

No. 4, coarse ore bins in mill.

No. 5, fine ore bins at mill.

No. 6, at No. 1 level 36" nearer raise.

No. 7, grab sample from old fills between levels 2 and 3.

No. 8, sample taken especially for tungsten as it showed up very good under the light ; the gold values in it were a surprise; This was taken above the third level by Mr. Darland.

In former operations no attention was paid to tungsten ore. These few samples show that there may be a very important element toward a profitable operation of the mine. Naturally these samples are just for Mineralization only, --they would not be representative.

On the No. 1 level in the south portion of the stoping area above, I was informed by Mr. Darland and others, that a winze was sunk there. This opening appears to be about eighteen feet long and three to four feet wide and is said to be about twenty feet deep.

This was full of water and was not accessible. The ore taken from there is said to average 2.11 ounces in gold per ton. This would indicate that the values continued below the deepest workings of the mine.

I have attached to the report the following pages of Mr. Darland's report as to three engineers who have reported and sampled the backfills, where all three place the values at 7.42 per ton, with an estimated tonnage of 18,000 tons; if this can be substantiated by careful sampling the ore could be handled with a good profit; the conditions for mining are ideal. The hanging wall is solid and not frozen to the vein in any places and does not require timber. The wall is smooth and shows some movement with accompanying talc. The slope of the foot wall is a little flat for ore to run, but can be handled readily by a slusher method. This vein appears to me to be true fault fissure, very strong and persistent and should carry its ~~flow~~ values to good depth. My opinion is the old hit and miss methods of mining which seems to have been done here, whenever the ore was improverished a little they simply quit. I see no evidence of lateral work along the vein insofar as I went to the upper stopes. It appears that a lenticular body of ore has been worked down to the lowest level with no attempt to explore either way. Naturally in all veins there are rich and lean strikes.

There are no claim maps, no data, no assay maps or maps of stoped areas, in fact, there is absolutely nothing on which to base an opinion. I have a report made by a geologist named A. G. Buritt which covers the geology of a great section of the surrounding country but does not mention the New York mine. It is a very nicely gotten-up report, numerous pictures of mountain scenery, etc.

There is no map of this particular property; there are a large number of assays from low grade dike, but no assay map. This dike is said to be fifty to seventy feet wide; the average assay would run around two dollars in gold, said dike goes through the Shamrock claims. Mr. Buritt concludes his report, and I quote:

6 copies

CONCLUSION AND RECOMMENDATION

This property, I think, fully justifies a thorough geological survey showing all veins and dikes with relative position to each other, together with competent sampling of all surface showings, and a complete new map showing all the surveyed claims with the geological survey maps incorporated.

The old mine workings, gobs and fills should all be sampled and included on a proper sampling map. A small diamond drill could be used underground to test the lateral extensions of the orebody. I would also suggest that a magnetoscope survey be made of the entire area , to be followed up by bulldozer cuts for values indicated. This to be followed by blacklite investigation for tungsten at night with the same prospecting where tungsten may be found.

I have no doubt this property will justify this expenditure and could result in a development of a new and important ore body.

I will state that mining in the present day has to be done with all the technical aid that is available and the cost of an independent investigation limits the possibility of failure. Proper sampling, drilling and assay can either prove or disprove the possibility of a commercial ore body. The initial cost is the gambling money. If the results are favorable, properly evaluated, necessary operations followed, it will undoubtedly be profitable. Much of the ground is timbered and unexplored and the evidence throughout of mineralization will justify these expenditures.

I do not recommend operation of the mine until this preliminary work has been done.

SUPPLEMENTAL REPORT ON NEW YORK MINE

My trip to the New York Mine with you ten days ago has not changed the recommendations and conclusions outlined in the original report with the exception of the large mineralized dikes and tungsten showings which were under snow on my first visit.

NEW YORK MINE

The large dike in the New York Mine south of the cabin on the hill shows no values in gold or silver; however, there is considerable tungsten showing under a black light. Also, there is a quantity of quartz float where this dike was sampled showing commercial values in tungsten. Directly below in the gulch is where you told me a quantity of high grade tungsten had been picked up and shipped.

This mountain shows no glaciation nor old channels, so naturally it must be an erosion product and still above present investigation. The surface is covered with brush, balsam fir and jack pine and shows heavy soil overburden. I recommend intensive dozer operation above this cut and in line with this float, until the source of this ore has been located. Dozer cuts should be examined thoroughly for the tungsten float. Also gone over at night with black light. Tungsten showing in the scope of the New York mine and coupled with the surface indications, I would consider it eligible for a Government loan. This showing is better in many respects than property I have seen who are receiving this aid. The Government pays seventy-five percent of the cost of this work. There is a strong showing of tungsten in the south extension of the New York stopes; it extends from the lower level upward as far as I have been able to go. The persistent occurrence of this mineral in this area of the New York ground, seems to hold a regular course up the mountain.

BUFFALO MINE

None of the workings are accessible. Old miners report good ore in the bottom of the old shaft. A large well mineralized dike has been opened by cuts. This is a schistose material highly altered. Samples taken over on the north end fifteen feet wide show no values. Samples on the south end sixteen feet wide gold and silver $1.60. Dike has a width of about a hundred feet at this point. This ground should have considerable dozer work and dike opened in several places and sampling following up these cuts.

BLUE ROCK CLAIM

This is located in the northeasterly direction from the New York. Shows a strong quartz vein, three to six feet wide; open by tunnel about sixty feet long. Samples take from face of tunnel five feet wide shows $1.40 in gold and silver. About ten tons of selective ore on the dump shows gold $22.40 and silver $3.60. This is a high quartz vein with slight dip to the east; I would consider this

Blue Rock Claim continued)

something for a later date; you have better showings and possibilities on the New York ground.

ONTARIO CLAIM

A tunnel has been run on the vein for 150 feet. This is caved. Dump samples were taken and showed only trace of value. Hand sample blue quartz only showed fifty-four cents. Do not consider this ground important at the present time. I had only a day on the property, no details on strikes, dips and distances were taken.

I emphasize the importance of opening these veins by doser combined with M-scope and black light examination. There is a large area that is covered completely. A very intensive prospecting program is indicated to find out what you have on the ground.

MILL EQUIPMENT

Your mill equipment seems to be in good condition consisting of crusher, ball mill, atlas deisel power and auxiliary water power. With the expenditure of about twenty thousand I believe the mill could be put in operation with your jigs and floatation units and repair of the mill building. The cross cut proposed to you by some engineer, from below the mill to the New York vein, is poor mining practice. I would suggest that you sink a winze inside the New York drift on the ore chutes and you will never go wrong in mining by staying on the ore.

4-C

FROM GEOLOGICAL REPORT BY SHENON & REED, U.S.G.S

The New York country rock is white massive, recrystalized quartzite; the ore is empregnated in different degrees by pegmatic materials; locally the quartzite grades into pegmatite; the quartzite in the field is distinguished with difficulty from the vein quartz, although the two can be oriented by microscope. The trend of quartzite is northeast and the ~~stick~~ strike is generally southeast, although the attitude is not uniform. A strike of North 50° East, with dips 40° southwest may approach an everage. There is difficulty in distinguishing between vein quartz and quartzite. The inaccessibility of a great portion of the workings, does not permit close geological study. The vein appears to follow bedding quartzite; a strong fault is exposed on the third level and also exposed on the second and fifth level. Movement appears to have been mostly along the altered body of andesite, which was originally a sill or dike cutting the quartzite at a slight angle. Trend of fault ranges from north to 30° west, dips 35° to 60° east. The third level has been driven over 200 feet along this fault, evidently mistaken for the lead.

It seems most likely that there is a cross mineral fault which cuts the bedding and also the vein, but apparently no ore has been found under or above this fault. The disposition of the ore in the fault is less promising than the large fault just described, along which seems to be the intersection of the vein and fault. It is probable that the quartz is older than the fault and came along in the intersection entirely in the foot wall of the larger fault. The vein is three to five feet and consists of massive white quartz. In most places the hanging wall is marked with a thin gouge or seam., and in a few places notably on the second level. Some pyrite, arsenopyrite and galena and mineral that looks like galena, except for a more perfect average, cleavage? was noted in the ore.

1-

Unidentified mineral material was seen in pegmatite in one instance. According to Jones the mill man, the concentrates from the old mill consisted of galena, sphalrite and pyrite. The gold was free in sulphides. The richest ore occurred in galena and sphalerite.

RECEIVED NOV 22 1955 D.M.E.R.

PURCHASE AGREEMENT

THIS AGREEMENT, made and entered into this 17th day of June, 1955, by and between HARVEY W. WHITE and HELEN WHITE, husband and wife, of Golden, Idaho, first parties, hereinafter called "Sellers," and W. O. (DUFFY) RANDOLPH, R.O. RANDOLPH ~~A. T. ROBERTSON~~, W. H. BAXTER, H. T. HARTWELL, AL LYNCH and GUS D. DARLAND, second parties, hereinafter called "Buyers;"

W I T N E S S E T H :

That for and in consideration of the covenants and conditions hereinafter contained, Sellers agree to sell and Buyers agree to purchase the following described mining claims and personal property located thereon, together with all water and water rights, ditches and ditch rights appurtenant thereto, and all buildings and surface improvements situate on said mining claims, to-wit:

> New York Mines, consisting of the Shamrock Group of mining claims located in Section 24, Township 27 North, Range 7 East of the Boise Meridian in Idaho County, Idaho, being fourteen (14) unpatented lode mining claims in the Ten Mile Mining District, subject to the paramount title of the United States of America; and
>
> All the personal property and buildings situate thereon, which personal property is more particularly described in Exhibit "A" attached hereto.

That for said mining claims and personal property the Buyers agree to pay unto Sellers the sum of FIFTY THOUSAND DOLLARS ($50,000.00), as follows:

Ten percent (10%) of the net smelter returns, net mint reyurns, or all other returns received by Buyers from the shipment and/or sale of ores, concentrates, or other marketable products mined and shipped from the above mentioned properties, but not less than $1,500.00 peryyear, which sum ~~of~~ $500.00 shall be due on the 1st day of September, 1955 and a like amount on the 1st day of March, 1956 and a like amount on the 1st day of June, 1956, and a like amount each and every year on the same dates thereafter until the purchase price has been paid in full. All royalties received during the calendar year shall be credited to the minimum payment of $1500.00 due during that calendar year.

Net smelter returns are computed and understood to be returns paid by the smelter after deducting only smelter penalty and transportation charges, including prepaid freight, on all such ores, concentrates or marketable products marketed at any smelter or marketing agency. All such sums as become due Sellers hereunder shall be paid to the escrow holder hereinafter designated, and there shall be deposited with each payment to the escrow holder where the payment is based upon the ten percent royalty, a smelter, mint or other return showing the amount received by the Buyers on the sale of the ore, concentrate or other marketable products sold from the premises.

The Buyers shall take possession of the above described mining claims and personal property on or before June 30, 1955, and shall be entitled to remain in possession so long as they are not in default under the terms and conditions hereof. Buyers are granted and permitted the right to cut timber from said mining claims for use in connection with the mining operations to be carried on by them, but timber shall not be cut for any other purpose, or sold

The Buyers agree to operate said mine in a good and miner-like manner, (and to keep Mine Developed ahead of Production) except in case of Labor Disputes, War Time Regulations, ~~or~~ Acts of God, and to maintain the personal property in as good a state of repair as the same now is. Said personal porperty shall not be sold or exchanged by the Buyers

RECEIVED

HW.

It is further promised and agreed that the Buyers will indemnify and save harmless the Sellers from all claims for damages, arising or to arise out of, or by reason of, Buyers use and occupation of said property and premises, whether such claims shall arise out of negligence of the Buyers, their agents, servants or employees, or otherwise.

except Buyers are hereby given the right to exchange said properties for other properties of like value and which would be more suitable for use in the mining operation. The title to the personal property and any exchanges or replacements shall at all times be vested in the Sellers, and Buyers shall not permit any liens or encumbrances to be filed against the personal property or the mining claims.

The Sellers shall have the right to inspect and go upon the mining properties at all reasonable times and to examine the underground workings, together with the equipment, in order to ascertain that it is being properly maintained, but shall not do so in such a manner as to interfere with the mining operations of the Buyers. Sellers shall have the right to examine the books and records of Buyers at reasonable times to assure themselves that the proper royalty is being applied and paid.

It is agreed that Buyers shall fully comply with the Workmen's Compensation Law of the State of Idaho and all amendments thereto and the Social Security Act and the Idaho State Insurance Law, and will comply with all state and federal laws relating to mining operations. The Buyers shall perform all necessary assessment work on said mining claims at least thirty (30) days prior to the time such work is required, and will file the necessary proof of labor in connection with such assessment work.

X Buyers will keep said real and personal property free and clear of all debts and liens for labor and material or otherwise, and notices will be kept posted upon the premises that said property is being operated under this purchase agreement and that neither the property nor

the owner shall be liable for or responsible in any manner for labor done upon or materials furnished for any mining operation or use upon the premises.

The Sellers agree that concurrently herewith, they will make and execute a deed for conveyance of the above described mining claims to Buyers, subject to the paramount title of the United States of America, and a bill of sale for conveyance of the personal property; which bill of sale and warranty deed, together with the original of this agreement, shall be deposited in escrow at the First Security Bank at Grangeville, Idaho, and all deferred payments due Sellers hereunder shall be paid to the escrow holder. The escrow holder is authorized and instructed that upon payment to it of the sum of $50,000.00, it shall deliver the deed and bill of sale to the Buyers.

It is agreed that time is the essence of this agreement, and should the Buyers fail to pay according to the terms of this agreement or fail to keep any of the covenants and agreements herein contained, the Sellers may, at their option, give written notice of such default, by registered mail, to Buyers at their last known post office address, in which notice it shall specify the matters in which Buyers are in default. Said notice and copy thereof shall be delivered to the escrow holder and by the escrow holder mailed, registered mail, to Buyers. Buyers shall have thirty (30) days from and after the mailing of said notice to correct the matters in which they are in default, and if not so corrected, the Sellers shall be entitled to the return of the deed and bill of sale held in

escrow and all sums paid hereunder by the Buyers shall be deemed liquidated damages and retained by the Sellers. Further, upon such forfeiture the Buyers shall immediately deliver over possession of the mining claims and the personal property in as good a condition as received, ordinary wear and use excepted, and remove themselves and their agents from the premises.

The Sellers specifically reserve unto themselves that certain hunting cabin located upon the above described mining claims located at the junction of the Buffalo-Idaho Road. Such reservation shall not affect title to the lands, but the use of such cabin is forever reserved unto the Sellers; but such use shall not be assigned or pass on to the heirs, executors or administrators of the Sellers. It being the intent that such use is for the Sellers alone and only during their lifetime.

It is agreed between the parties that an inventory will be made of the personal property located on the mining claims and such inventory shall be signed by the Sellers and one or more of the Buyers as a true inventory and attached hereto and made a part of this agreement as Exhibit "A". Said inventory, as Exhibit "A", shall cover the personal property to be conveyed by the bill of sale aforementioned.

This agreement shall be binding upon the heirs, executors, administrators, successors and assigns of the respective parties hereto.

IN WITNESS WHEREOF, the parties hereunto have set

their hands and seals the day and year in this agreement first above written.

ESCROW AGREEMENT

To First Security Bank of Idaho
Grangeville Branch
Grangeville, Idaho
(Address)

The undersigned, HARVEY W. WHITE and HELEN WHITE, husband and wife, of Golden, Idaho

hereinafter called "Grantor," and W. O. (DUFFY) RANDOLPH, R. O. RANDOLPH, W. H. BAXTER, N. T. HARTWELL, AL LYNCH and GUS DARLAND,

hereinafter called "Grantee," herewith deliver to you in escrow the documents and property hereinafter described to be held and disposed of by you in accordance with the instructions and upon the terms herein set forth and not otherwise, to all of which the undersigned hereby agree. Said documents and property are described as follows:

1. Purchase Agreement dated June 17, 1955
2. Quitclaim Deed dated June ___, 1955
3. Bill of Sale dated June ___, 1955

You are hereby authorized and directed to deliver the above described documents and property to Grantee upon payment to you, at the address above specified, for the Grantor of the total sum of $ 50,000.00, principal, and interest on the unpaid balance thereof at none per cent per annum from - - to be paid as follows:

(Specify date and amount of each payment of principal and dates of interest payment.)

Ten percent of the net smelter returns, net mint returns, or all other returns received by Buyers from the shipment and/or sale of ores, ore concentrates, or other marketable products mined and shipped from the properties covered in the contract, but not less than $15,000 per year, of which sum $500 shall be due on the first day of September, 1955 and a like amount on the first day of March, 1956 and a like amount on the first day of June, 1956, and a like amount each and every year on the same dates thereafter until the purchase price has been paid in full. All royalties received during the calendar year shall be credited to the minimum payment of ~~$15,000~~ 1500 00 due during that calendar year.

Provided, however, that you are authorized to receive any or all such payments or any part thereof at any time after the above dates specified therefor (hereinafter referred to as the due dates) and prior to delivery of said documents and property to Grantor as hereinafter provided, with like effect as if paid on or before said due date.

If, however, at any time prior to full payment of all principal and interest above specified, Grantor delivers to you at the office above specified, written demand for the delivery of such documents and property to him, specifying in detail as grounds therefor, either:-

(a) That all or any part of any payment of principal or interest above specified remains unpaid and that the due date therefor has passed; or

(b) That Grantee has failed to perform any specified term or condition, other than payment of principal and interest, encumbent on him to be performed, under that certain contract dated June _____, 1955 made by and between Grantor herein as one party and Grantee herein as the other party, copy of which is deposited with you herewith for purposes of identification, then in such event or events, hereinafter called defaults, you shall promptly deliver to Grantee personally, or at your option deposit in the United States mail, postage prepaid, addressed to Grantee at ..... or at such other address as he may have directed by writing previously delivered to you at the branch above designated, copy of such demand. If it appears by your records that all payments of principal or interest designated in said demand and for which the due date has actually arrived are fully paid, or if not, then if the same be paid before the expiration of thirty (30) days after said copy of demand is so delivered or mailed to Grantee and within the same time Grantee also proves to your satisfaction that none of the other defaults, if any, specified in said demand existed at the time said demand was made or if they did that they do so no longer, Grantor's said demand shall be desregarded and you shall continue to hold said documents and property under the terms hereof and to receive the payments as above specified at the times and on the same conditions and to the same effect as if no such demand had been made; otherwise all said documents and property then held by you shall be delivered to Grantor; provided, however, that you may at your option at any time without liability to anyone, withhold delivery of all said documents and property and decline to receive further payments hereunder until your rights, powers, and duties hereunder in any respect requested by you have been settled acceptably to yourselves by further written instructions of the undersigned or finally determined by judicial action.

It is further agreed that this instrument contains the entire agreement between you and the undersigned, or any of them, and that you are not a party to nor bound by the contract referred to in paragraph designated (b) above, or any provision thereof, nor by any instrument or agreement other than this, whether between or among the undersigned themselves, or otherwise; that you shall not be required to take notice of any default or any other matter, nor bound by nor required to give any notice or demand, nor required to take any action whatever except as herein expressly provided; and you shall not be liable for any loss or damage not caused by your own negligence or willful misconduct.

The undersigned agree to pay you as compensation for your services hereunder an initial fee of $....., an annual fee of $..... payable annually in advance for each additional year or fraction thereof after the first year that any money, document or property shall be held by you hereunder, and an additional fee of 1/10th of 1% (but not less than..... on each collection) of all funds received by you hereunder, together with all actual and necessary expenses and liabilities you may incur hereunder, for all of which you are granted a first lien on all of the above described property and documents and all funds coming into your hands hereunder, and you shall be under no obligation to deliver any of said documents, property or funds until such lien is discharged, anything herein contained to the contrary notwithstanding.

All funds collected on this escrow are to be distributed as follows:

First: To the payment of all escrow fees, charges, and expenses of the escrow agent incident to this account.

Second: The escrow agent is authorized to expend from funds received any amounts due for Revenue Stamps on deeds at the time the deed is delivered.

Third: The balance is to be remitted to ..... at the following address ..... or any other address subsequently furnished by the above named party entitled to receive funds collected on this escrow.

The words "Grantor" and "Grantee," and the language of this instrument, where there is more than one grantor or grantee, shall be construed as plural and be binding equally on all such grantors and/or grantees, and in cases where one or more are females, the masculine shall include the feminine. The word "undersigned" as hereinbefore used, refers to the grantors and/or grantees, and not to you.

IN WITNESS WHEREOF, the parties have executed this instrument, in triplicate, this ..... day of June, 19 55 at .....

Re: New York Mining Company, Inc.

Dear Mr. Clemons:

Receipt is acknowledged of amendments to the exhibit of the above issuer filed with this office on May 16, 1956.

The amendments filed appear to reflect our comments and the offering may be commenced without further waiting period.

It is understood that this material will not be used as sales literature.

Kindly supply triplicate copies of the offering circular in its final form.

Also kindly supply reports required by Rule 224 on Form 2-A at the end of the required 6-month period.

You appreciate that Section 23 of the Securities Act prohibits the Commission from making a finding that information filed is true and correct and from passing upon the merits of, or giving approval to, any security. For this reason, this acknowledgment in no sense indicates that the Commission has considered the accuracy or completeness of the material filed or has determined that the exemption provided by Regulation A is available. The responsibility of complying with the Regulation must in all cases be assumed by the person seeking the exemption and the availability of the exemption depends upon the factual compliance with applicable provisions of the Regulation.

Very truly yours,
James E. Newton
Regional Administrator

Attention: Mr. Gus D. Darland

Dear Mr. Darland:

I hope that you had a very comfortable trip home after visiting us last week.

We have some good information to report to you at this time since we have just received a written report back from our laboratory technicians.

The laboratory reports that the gravity concentration test on the submitted sample for tungsten recovery revealed that a relatively fine grind would be required to liberate the gold, silver and tungsten values from the gangue. The flowsheet submitted under Order No. YM-6796 (this is the flowsheet we looked at in our laboratory) for treatment of this same ore is more fully varified by the results of the gravity concentration test just conducted. The gravity test results are as follows:

PRODUCT	% Wgt.	ASSAY WO_3 %	ASSAY Au oz/ton	ASSAY Ag	RECOVERY % WO_3	RECOVERY % Au	RECOVERY % Ag
Head Sample		0.45	0.31	0.70			
Calculated Heads	100.00	0.35	0.45	0.55	100.0	100.0	100.0
Non Magnetic Conct.	0.26	59.20	40.86	20.60	43.6	23.3	9.8
Magnetic Conct.	0.23	18.20	68.30	39.50	11.8	34.5	16.6
Table Middlings	5.13	0.86	0.06	0.88	12.5	0.7	8.2
Table Tailing	94.38	0.12	0.02	0.38	32.1	41.5	65.4

A test similar to previous tests consisting of fine grinding, and flotation of gold-silver as one concentrate, and scheelite as a second concentrate is indicated.

We know that you will find this information quite valuable

Re: Docket No. DMEA 4552 - Tungsten
New York Mines
Idaho County, Idaho

Gentlemen:

Our letter of April 26, 1957, denying the subject application for exploration assistance by the Defense Minerals Exploration Administration, added that, because an examination of the surface area of your property was not made on account of snow conditions, we would gladly have your property re-examined when weather conditions permitted.

Accordingly, the property was re-examined on September 14, 1957. We regret to advise you, however, that nothing was found to change the above-noted denial.

We wish to thank you again for your interest in the Defense Minerals Exploration Administration program and for bringing your property to our attention.

Sincerely yours,

Frank E. Johnson (for)

MEMORANDUM:

To: Administrator, DMEA

From: Division of Iron and Ferro-Alloys, DMEA

Subject: Supplemental Memorandum
Denial of request for exploration assistance in the amount of $95,753.11
Docket No. DMEA 4552 - Tungsten
New York Mining Company, Inc.
New York Mines
Idaho County, Idaho

Denial of the subject application is recommended by this Division based on the following information:

This application for exploration assistance was denied on April 26, 1957. The denial, however, was qualified by the statement that, because snow conditions at the time of the field examiners' visit made impracticable any detailed study of the surface of the deposit, a re-examination would be made at a time when the surface of the tract could be studied.

That re-examination has now been made, and the Field Team concurs with the recommendation of its examiner that the application again be denied. The Commodity Divisions of the Bureau of Mines and Geological Survey concur in this recommendation.

In the Supplementary Field Examination Report, dated October 3, 1957, the examiner notes that the location of the property, as given in previous reports, is incorrect. The correct location is in sec. 24, T. 29 N., R. 6 E., B. M.

IN REPLY REFER TO:

UNITED STATES
DEPARTMENT OF THE INTERIOR
GEOLOGICAL SURVEY
WASHINGTON 25, D. C.

Memorandum ✓ October 14, 1957

To: W. S. Martin, Defense Minerals Exploration Administration

From: W. P. Williams, U. S. Geological Survey

Subject: Review of memorandum field examination report, DMEA 4552 (tungsten), New York Mining Company, Inc., Shamrock mine, Idaho County, Idaho.

The subject application was denied on a provisional basis on April 26, 1957. On that date the applicant was told that although his application was being denied on the basis of a partial examination, a re-examination would be made when the surface of the property was free of snow and ice.

The examining geologist has re-examined the property and reports he could find no new evidence to alter the previous recommendation for denial.

I agree with the recommendation for denial because discovery of ore would probably not result from the proposed project.

Re: Docket No. DMEA-4552 (Tungsten)
New York Mining Company, Inc.
New York Mines (or Shamrock Mine)
Idaho County, Idaho

Dear Mr. Selfridge:

Enclosed are three copies of a memorandum report by D. C. Alvord, Geologist, U. S. Geological Survey, on a supplementary field examination of the subject property.

Alvord could find no scheelite in place on the surface and underground, and could find no new evidence to alter the conclusions and recommendations made by Walker and Nickelson in their report forwarded to you March 29, 1957.

The Field Team concurs with Alvord's recommendations that the application be denied.

MEMORANDUM

To: DMEA Field Team, Region I

From: D. C. Alvord, Geologist, U. S. Geological Survey

Subject: Supplementary Field Examination Report, Docket No. DMEA-4552 (Tungsten), New York Mining Company, Inc., New York Mines (or Shamrock Mine), Idaho County, Idaho

An application for aid to explore the subject property for tungsten was received at the Spokane office on November 15, 1956. The property was examined on January 30, 1957, by H. B. Nickelson and D. D. Walker, who recommended that the underground work proposed by the applicant be denied (memorandum dated February 20, 1957). Due to snow and ice, however, Nickelson and Walker were unable to examine the surface area nor were they able to see all of the No. 1 level from which the proposed underground exploration was to take place. The company was notified that its application was denied in a letter from the Acting Administrator dated April 26, 1957, which at the same time acknowledged that the examination was not complete and that the property would be re-examined, should the applicant so request, when weather conditions permitted. In a telephone conversation on September 4, 1957, Mr. Gus Darland, manager of New York Mining Company, Inc., stated that the property was ready for re-examination.

Pursuant to the above, the New York property was examined by the author on September 14 in company with Gus Darland, Manager; H. Zerold, President; R. B. Rick, Superintendent; and H. Barker, Mine Foreman. The group arrived on the property about 8:00 a.m. and left about 9:30 p.m. The day was spent in a black-light examination of all open mine workings on the New York vein and in making a reconnaissance of the surface traces of the New York vein and of the Ontario vein to the east, in order to facilitate a black-light traverse at night. After dark, about 2 hours were spent examining the surface with the black light.

Reviewed by
DMEA OPERATING COMMITTEE
10-9-57
(date)

The location, mine development, production, geology, etc., are discussed in some detail by Walker and Nickelson in their memorandum, and for the purpose of this report little more need be said. Incidentally, the property is in sec. 24, R. 6 E., T. 29 N. and not in sec. 24, T. 27 N., R. 7 E. as reported in all docket material previous to this report.

Where visited, the property is underlain by granitic-banded gneisses that locally grade to augen gneiss, gneissic quartzite, and quartz mica schist. Quartz veins, mostly small, cut the rocks at several localities but only two, the New York and the Ontario, are considered worth-while by the applicant. The New York vein, already carefully checked for tungsten and described by Nickelson and Walker, trends northward and dips 45°-55° E. The Ontario vein, so-called by the applicant, is exposed in a few cuts 400 to 500 yards east of the New York. Due to poor exposure the strike and dip of the Ontario vein or veins(?) could not be determined with confidence but it may strike N. 15°-20° W. and dip steeply to the east. Both veins are composed of fine-grained quartz with minor amounts of sulfide minerals. Pyrite and arsenopyrite with lesser amounts of tetrahedrite and molybdenite are among the more conspicuous sulfides. Scheelite occurs in the New York vein as small veinlets and lenticular zones of disseminated crystals, both in close association with sulfides and well away from sulfide minerals in the megascopically otherwise barren quartz. Ore produced from the New York vein has probably averaged about $25 per ton in gold under current prices. Nothing is known of the gold values in the Ontario vein. No tungsten has been recovered from either vein.

Underground, on the New York vein, essentially nothing was seen by the examiner that Nickelson and Walker didn't see during their examination. Because I used a large high-intensity mineralight and Nickelson used a small comparatively weak lamp, the applicant informs me that several more minor showings were found in the stopes and drift walls, during this latest examination, than were found previously, but at the same time the applicant admitted that these minor discoveries did not significantly alter the picture. Apparently, since Walker and Nickelson's examination, the only new work done underground consisted of an inclined shaft at the north end of the No. 1 Drift level, which was down a scant 8 feet (see attached figure). This work disclosed ½ to 1½ feet of quartz vein containing crystals and stringers of scheelite sparsely distributed along the entire exposure. A sample cut across the best looking portion contained 0.19 ounce of gold per ton but only 0.07 percent WO_3.

The examination of the veins at the surface found absolutely no scheelite in place. The only scheelite found consisted of a single very fine crystal occurring in a piece of quartz float from a cut

dump on the Ontario vein. At the conclusion of the examination the applicant volunteered that on the basis of the present exposures the Ontario vein shows no promise as a tungsten producer and that we hadn't seen anything in the New York vein that would significantly alter the results of the examination made by Walker and Nickelson.

Although the New York mine undoubtedly has some potential as a gold producer, its promise as a potential tungsten producer is in considerable doubt. The mapping, location and grade of samples shown on the figure accompanying Walker and Nickelson's report indicate that small, narrow tungsten-bearing zones, either below ore grade or too small and discontinuous to base reserve computations upon, are present in the New York vein but that in all probability the structure is not capable of producing a significant amount of tungsten. It appears that Government-supported exploration on the New York vein would amount to Government subsidy of gold mining.

At the time of the examination the applicant was getting the mill, located near the portal of the No. 1 Drift level, into shape for operation and had apparently spent considerable money in new equipment. Their stated intentions are to begin mining by stoping above the No. 1 level and from sublevels off the incline shaft and to mill the ore for both gold and tungsten. Such an operation, should it prove economically successful, might show that the New York vein is capable of producing significant amounts of tungsten and in such an event Government participation in its exploration might be justifiable. On the basis of the information presently available, however, it is recommended that the application be denied.

Re: Docket No. DMEA-4552 (Tungsten)
New York Mining Company
New York Mines
Idaho County, Idaho

Dear Mr. Price:

Mr. H. A. Zierold called at the Spokane office July 24, 1957, to ask if a re-examination of the New York mines could be made. While such an examination would be primarily to look at the surface exposures and trenches, the examiners will also be glad to look at any new underground work, or any parts of the old workings that were inaccessible at the time of the examination last winter but which might now be accessible.

I advised Mr. Zierold that a request for a re-examination must be made in writing and should be accompanied by a map showing the claim boundaries, the location of any new work, whether on the surface or underground, the locations of any new samples, and assays of the samples.

So far we have heard nothing further. We expect to have an examining team in Idaho sometime within the next three or four weeks and would like to know whether or not you wish them to include the New York mines in their itinerary.

Sincerely yours,

D. R. MacLaren
Acting Member, DMEA

Re: Docket No. 1552 - Tungsten
New York Mines
Idaho County, Idaho

Gentlemen:

Your application for aid for an exploration project and other data available to us in Washington concerning the above-referenced property have been reviewed.

Projects approved by the Defense Minerals Exploration Administration must, in its judgment, show definite promise of yielding materials of acceptable grade in quantities that will significantly improve the mineral supply position for the National Defense Program.

Careful study of our information, although noting tungsten mineralization on the New York Mines (Shamrock) group of claims, indicates to us that the probability of disclosing significant tungsten ore reserves on your property is not sufficiently promising to justify Government participation in its exploration. Under these circumstances, we regret to advise you that your application for aid in an exploration project is denied.

However, because an examination of the surface area of your property was not made on account of snow conditions, we will gladly have your property re-examined when weather conditions permit.

You should notify Mr. A. E. Weissenborn, Executive Officer, DMEA Field Team, Region I - Northwest District, South 157 Howard Street, Spokane 4, Washington, when a re-examination can be made.

Sincerely yours,

Frank E. Johnson (for)

MEMORANDUM

To: Administrator, DMEA

From: Iron and Ferro-Alloys Division, DMEA

Subject: Denial of request for exploration assistance in the amount of $95,753.11
Docket No. DMEA 4552 - Tungsten
New York Mining Company, Inc.
New York Mines
Idaho County, Idaho

Denial of the subject application is recommended by this Division based on the following information:

(1) The applicant, New York Mining Company, Inc., c/O W. E. Price, Box 931, Nampa, Idaho, requested exploration assistance in the amount of $95,753.11 for drifting, crosscutting, raising, and bulldozer trenching on the New York Mines (Shamrock) group of claims.

(2) The applicant owns 10 unpatented lode mining claims, situated 4½ miles north of Fall Creek, Idaho, in sec. 24, T. ~~27~~ 29 N., R. 7 E., B. M., Ten Mile Mining District, Idaho, and recorded in the Idaho County Recorder's Office at Grangeville, Idaho, as follows: See F.T. Report of Oct. 3, 1957

Claim Name	Recorded Book	Recorded Page
Shamrock 1	65	593
" 2	65	594
" 3	65	595
" 4	65	596
" 5	65	597
" 6	65	598
" 7	75	111
" 8	75	113
" 9	75	114
" 10	75	112

(3) The proposed program is to explore the tungsten deposits on the New York Mines (Shamrock) group of claims by raising 300 feet in two raises, drifting 300 feet from the raises, and crosscutting 250 feet below the main adit level, with 400 days of bulldozing surface trenches.

8623

(4) In the area of the New York Mines (Shamrock) group of claims tungsten occurs as small veinlets or lenses containing disseminated scheelite, associated with gold-bearing quartz veins in granite.

(5) The Field Team, noting that its examination was made, at the applicant's request, in winter weather when the ground was covered with snow, and some parts of the underground workings were not accessible for inspection because of ice coating rock surfaces, concludes that, on the basis of evidence found in the accessible portions of underground workings, there is no justification for the proposed underground exploration, and therefore recommends that the request for underground work be denied, but that reconsideration should be given when weather permits a re-examination in connection with that part of the applicant's proposal which refers to surface trenching.

This property was the subject of a DMA application which was changed to a DMEA project under Docket No. DMA-317X. No examination report was prepared at that time, but a letter dated July 16, 1951, from the Field Team to the Chairman of the Tungsten Commodity Branch concluded with this statement: "The mine can be considered as being only marginal or sub-marginal, and the Field Team recommend approval of the application only if the tungsten situation is very critical." After consideration by the Tungsten Branch the application was denied.

Tungsten

Memorandum

To: W. S. Martin, Defense Minerals Exploration Administration

From: N. E. Nelson, U. S. Geological Survey

Subject: Review of preliminary Field Team Report.

The applicant requested assistance in reopening an old gold mine and bulldozing to find the origin of scheelite-bearing float.

The examiners visited the mine and inspected and sampled the showing in an accessible place in a stope above No. 2 level. The material sampled is narrow and only one sample is of ore grade, viz:

Sample No.	Width	Oz. Au	Oz Ag	$\%WO_3$
3	1.0'	0.64	0.7	1.37%

Other samplings confirm that of the examiners and indicate that the vein is spotty insofar as scheelite is concerned and underground work is not warranted.

The examiners intend to inspect the surface, come summer.

The property was the subject of an application to DMA (317) in 1951. The application was denied.

The recommendation of the examiners, that the request for assistance in doing underground work be denied, is justified. The report on surface conditions will be awaited.

I concur with the recommendation of the examiners and Field Team concerning work underground.

Mr. George C. Selfridge, Chairman
Operating Committee, DMEA
Department of the Interior
Washington 25, D. C.

Re: Docket No. DMEA-4552 (Tungsten)
New York Mining Company, Inc.
New York Mines or (Shamrock Mine)
Idaho County, Idaho

Dear Mr. Selfridge:

Enclosed are four copies of a memorandum examination report by D. D. Walker, mining engineer, and Howard B. Nickelson, geologist, based on an incomplete examination of the above-referenced property.

The applicant proposes underground exploration on and near the New York mines, based upon tungsten showings on several levels and in the stope walls, and surface trenching based upon scheelite-bearing float. Because of the proposed surface trenching, we preferred to postpone the examination until the surface would be free of snow, but the applicant requested that an examination of the underground workings be made so that a decision could be made respecting that phase of his proposal.

Nickelson and Walker conclude that on the basis of the evidence found in the accessible portions of the workings, there is no justification for the proposed underground exploration. Because ice and water prevented observation of the entire crosscut and drift and because another examination will be necessary to consider the proposed surface trenching, Nickelson and Walker recommend that no further action be taken until the property shall have been re-examined.

Because the applicant has requested early consideration of the underground proposal, the Field Team recommends that he be advised

Reviewed by
DMEA OPERATING COMMITTEE

to the effect that, on the basis of what was seen, his request for underground exploration is denied, but that reconsideration will be given when a re-examination is made in connection with the proposed surface trenching.

MEMORANDUM

To: DMEA Field Team, Region I, Northwest District

From: D. D. Walker, Mining Engineer, U. S. Bureau of Mines and Howard B. Nickelson, Geologist, U. S. Geological Survey

Subject: Field Examination Report, Docket No. DMEA-4552 (Tungsten), New York Mining Company, Inc., New York Mines (or Shamrock Mine) Idaho County, Idaho

DMEA

INTRODUCTION

On November 15, 1956, Mr. Gus Darland, manager of the New York Mining Company, called at the U. S. Geological Survey office in Spokane and left an application for DMEA assistance to explore a gold-tungsten property near Fall Creek, Idaho.

This property was the subject of a DMPA application which was changed to a DMEA project under docket DMA-317X. No examination report was prepared at this time but a letter dated July 16, 1951, from the Field Team to the Chairman of the Tungsten Commodity Branch concludes with this statement: "The mine can be considered as being only marginal or submarginal, and the Field Team would recommend approval of the application only if the tungsten situation is very critical." After consideration by the Tungsten Branch the application was denied.

an SITE EXAM

In December 1956, the applicant phoned and stated that he would appreciate having the Field Team make an immediate examination of the underground workings and make their recommendation for that phase of his proposal. Mr. Darland was willing to forego the surface examination until spring so that the underground work proposed could be started if the application was recommended.

On January 30, 1957, in the company of Mr. Darland, the property was examined by H. B. Nickelson and D. D. Walker. This examination was limited to the underground workings as snow covering the ground to depths of 2 and 3 feet made a surface examination impossible. The main crosscut and the drift where the proposed underground exploration was to take place were both half filled

Reviewed by
DMEA OPERATING COMMITTEE
4-5-57
(date)

with ice, making a thorough examination of these workings virtually impossible. However, the stopes were examined and four samples were cut across the scheelite vein in the proposed exploration area. This 6-inch vein was exposed for about 40 feet at the south end of the stope just above the No. 2 level. Only one of the four samples cut assayed ore grade. This sample contained 1.37 percent WO_3. The scheelite appears to be scattered as specks and veinlets throughout the gold-quartz vein but the over-all tungsten content is very low.

RECOMMENDATION

On the basis of this examination we can only recommend that the underground work proposed by the applicant be denied. However, as a return to the property during the spring or summer to examine the surface is necessary, and as a more thorough inspection of the main crosscut and drift might bring to light a more promising target than could be found in the stopes, we suggest that no final action be taken until the property has been re-examined.

LOCATION AND ACCESSIBILITY

The New York Mines (Shamrock group of mining claims) lies 4½ miles north of Fall Creek, Idaho, in the Ten Mile Mining District, sec. 24, T. 27 N., R. 7 E. B. M., Idaho County, Idaho. Grangeville, Idaho, is the nearest railhead.

The property is reached by a winding mountain road which must be plowed out in the winter; snowfall reaches depths of 4 to 5 feet in this area.

PROPERTY

The property consists of 10 unpatented mining claims known as the Shamrock group. These claims are recorded at the Idaho County Recorder's office, Grangeville, Idaho, as follows:

Name of claim	Book	Page
Shamrock 1	65	593
2	65	594
3	65	595
4	65	596
5	65	597
6	65	598
7	75	111
8	75	113
9	75	114
10	75	112

The proposed exploration will be done on the Shamrock 1, 3 and 5 claims.

MINE WORKINGS

All work has been on the original New York claim, except about 200 feet of crosscut which has been driven on the original Mississippi claim and 200 feet of crosscut on the original Georgia claim. This work totals 3,625 feet of development consisting of 2,915 feet of drifts and crosscuts and 710 feet of raising.

PRODUCTION

Authentic production records prior to 1934 are not available but estimates of total production to that year are $394,000, the values occurring from free milling gold. From 1934 to 1937, 2,396.58 tons of ore were mined and milled by H. W. White, who recovered $62,597.97, an average of $25.97 per ton.

In 1938, Mr. White made his last shipment to the smelter. Data from the settlement sheet are as follows:

48.262 tons:	2.345 fine ounces gold/ton 1.688 fine ounces silver/ton
Gross settlement	$3,219.18

No tungsten has been recovered from the gold mining operation.

APPLICANT'S PROPOSED EXPLORATION PROGRAM

A summary of the applicant's proposed exploration showing costs is given below:

300 feet of raising @ $55/ft. (4'x12' raise)	$14,500.00
No. 1 raise at junction of crosscut and drift on No. 1 level.	
No. 2 raise at south end New York vein in main tunnel.	
300 feet lateral drifting from raises (5'x7' drifts) @ $31/ft.	9,300.00
250 feet crosscut (5'x7') to explore below main level @ $31/ft.	7,750.00
Rent drifters, etc. Truck and Jeep, welder, power saw	3,540.00
12 days bulldozing to open upper adits for ventilation @ $100/day	1,200.00

Comp. and tugger work on open cuts and U.G. (1 yr.)	8,400.00
40 days bulldozing open cuts @ $100/day	4,000.00
	$48,690.00

These costs appear in the applicant's proposal, Item 6D.

In general, the applicant's costs appear to be excessive and his cost breakdowns are very confusing. Some items appear but are not summarized or totaled. There also seems to be some repetition of major costs. A general summary is as follows:

Item	Description	Cost
6B	Supervision, Consultants for 1 year	$12,000.00
6C	Operating Materials and Supplies costing less than $50 each	9,093.11
6D	Operating equipment (all costs given in applicant's list are included, although some may actually be repetitions)	48,690.00
6E	Rehabilitation and repairs	1,400.00
6G	Cook and Bull Cook - $200/mo. each	4,800.00
	Mech. & Blacksmith - $16/day ($350/mo.)	4,200.00
	2 drillers - $16.95/day	5,085.00
	2 helpers - $15.95/day	4,785.00
6H	Contingencies	5,700.00
		$95,753.11

OPERATING EQUIPMENT

Most of the operating equipment will be rented. It is as follows:

Item	Cost/mo.	Period	Total cost
D7 cat	$100/day	52 days	$5,200.00
Comp. and tugger	350/mo.	1 year	4,200.00
Drifters and steel	100/mo.	1 year	1,200.00
Truck	100/mo.	1 year	1,200.00
Jeep	50/mo.	1 year	600.00
Welding & blacksmith equipment	25/mo.	1 year	300.00
Power saw	20/mo.	1 year	240.00
Comp. and equip.	350/mo.	1 year	4,200.00

COMPETENCE OF THE APPLICANT

Mr. Al Lynch, the foreman, has been engaged in operating mines for quite some time and is capable of directing the operation. The New York Mining Company is able to finance its share of the expenses.

GEOLOGY

The district is described by P. J. Shenon and J. C. Reed in U. S. Geological Survey Circular 9, "Geology and Ore Deposits of the Elk City, Oregrande, Buffalo Hump and Tenmile Districts, Idaho County, Idaho," 1934. The mine has been described by L. E. Shaffer, mining engineer, U. S. Bureau of Mines in War Minerals Memorandum, 1943. A. J. Kirby also described the mine in a memorandum dated October 17, 1937, with a supplement dated May 27, 1940.

Shaffer's map, to which assays of samples taken by the DMEA examiners have been added, is included with this report.

Shenon describes the country rock at the mine as a white, massive, recrystallized quartzite, which is impregnated to different degrees by pegmatitic material. The trend of the quartzite is northeast, and it dips in general to the southeast. The wall rock appeared to the writer as a siliceous granite containing various amounts of altered feldspars. Also, tactite was found in the upper stopes. Shaffer mapped the vein trending northerly and dipping 45°-55° east, whereas Shenon stated the vein is controlled by the bedding which strikes northeast and dips southeast. The examiners agree with Shaffer.

The maximum length of the ore shoot that was mined just below the No. 2 level is about 320 feet. The width of the stopes that were examined averages about 6 feet. The vein has been stoped up the dip for approximately 850 feet as shown on the attached map.

The vein is composed of quartz with minor amounts of disseminated sulfide minerals containing the gold and silver. The average gold content of the ore mined is reported to be about $25 per ton. Scheelite occurs as small veins or lenses associated with the gold-bearing quartz vein. The major portion of the scheelite observed occurred as finely disseminated particles in quartz, rarely as crystals. Most of the scheelite fluorescence observed under the black light is a white subdued halo and not the sharp star-colored fluorescence associated with most scheelite crystals.

The examiners crawled through the stope along the south end from No. 1 level to the No. 5 level. The applicant reported an 8-foot lense of scheelite, 18 inches wide, in the floor of the

No. 5 level but a recent fall of rock covered this showing. A small stringer was lamped on the No. 4 level as shown on the attached map. Just above the No. 2 level, a stringer of scheelite about 6 to 8 inches wide, within the footwall of the quartz-gold vein, was sampled. Sample No. 1 was cut 0.8 foot across the vein and it assayed 0.6 ounce gold and 0.8 ounce silver per ton, and 0.45 percent WO_3. Sample No. 2 was cut across 1.5 feet in the hanging wall at the same location as Sample No. 1 and it assayed 0.03 ounce gold and trace of silver per ton, and 0.15 percent WO_3. Sample No. 3 cut 1.0 foot across the vein assayed 0.64 ounce gold and 0.7 ounce silver per ton, and 1.37 percent WO_3. Sample No. 4 was cut 0.7 foot across the vein and it assayed 0.12 ounce gold and 0.1 ounce silver per ton, and 0.31 percent WO_3. This vein was exposed near the footwall of the main quartz vein and it extended about 40 feet along the south end of the stope. The scheelite exposed in the drift on the No. 1 level is as shown on Shaffer's map attached.

Considering the gold production from the mine and the size of the ore shoot, it appears that the property is a small gold producer, but the possibilities of it being solely a tungsten mine is doubtful. Some low-grade scheelite concentrates may be recovered if the tails from the present mill were tabled.

The applicant's proposal of driving raises in the footwall of the vein would not be the logical method of exploration. The same targets could be explored by a drift or drifts along the scheelite vein off the stope just above the No. 2 level.

CONCLUSION

The scheelite observed in the underground working occurs as small scattered lenses associated with a quartz-gold vein. It is found as fine particles disseminated in quartz and as small veinlets which may be difficult to recover. It is therefore concluded that the chance of discovering a significant deposit of scheelite ore is less than fair.

Since the snow condition made it impossible to examine the property completely, another examination of the property is recommended when the weather permits.

Gentlemen:

The above-docketed application for exploration assistance for tungsten ores has been reviewed by the Iron and Ferro-Alloys Division of the Defense Minerals Exploration Administration and referred to Mr. A. E. Weissenborn, Executive Officer, DMEA Field Team, Region I, NorthWest District, South 157 Howard Street, Spokane 4, Washington, for a field examination of the property.

Any assistance that you can give the members of the Field Team will be appreciated.

Sincerely yours,

C. O. Mittendorf

WSM

Memorandum

To: W. S. Martin, Defense Minerals Exploration Administration

From: N. E. Nelson, U. S. Geological Survey

Subject: Review of application.

The applicant requests assistance in the reopening, and at least partial re-equiping, of an old gold mine and prospecting for and exploration of veins reputed to be scheelite bearing. Some 32 assays of scheelite samples are quoted of which 12 are of ore grade, but no details concerning the sampling are given and some of the 12 samples probably represent selected material.

A number of float samples containing scheelite seem to have been found. Their discovery prompts a large amount of bulldozing for inferred veins. The Shenon and Reed report lends little support to the application.

The Field Team appears satisfied that an examination is warranted. Therefore referral to it of the application is recommended.

Attention Don McLaren:

Sorry I didn't get this Exhibit 6-E out to you sooner, but was delayed at the mine and snowed in until we Bull-Dozed out, then wrecked my car on ice coming out. Then our man Lynch was out of town. So everything was against me to get the information back to you sooner.

I am going back to the mine the 28th. I'll be in Spokane after supplies about the 1st. I'll call you to see if you need any more information regarding our application.
