Dma-1113

1. [illegible] Chrisman [illegible] Milling Corporation, [illegible] Early Ave., Albuquerque, N. M.

   a. Minor Products of Columbite and rare earths
   b. Location - Rio Arriba County New Mexico, T.27 N. Range [illegible]

2. Production of Columbite from Pegmatite reported.

   History & Geology

   [illegible] District in northern New Mexico contains a great number of pegmatites. Bureau of Mines [illegible] Bulletin 25, compiled in 1906 covered this District secured some domestic resources of the [illegible] minerals. During World War II some mica mining was conducted and these minor minerals were found in the pegmatites.

   During the summer of 1950, the present owners of the property started to do some exploration and discovered an appreciable amount of columbite and rare earths in the form of a placer deposit. Several sites have been sunk to bed-rock and complete sampling has been done. The mineral columbite is found in the gravel beds. To date nearly [illegible] test pits have been sunk. The mineral is found in different sizes ranging from about one-quarter to plus one-quarter inch in diameter. The final block sands contain about [illegible] columbite and other rare earths.

   Approximate twenty thousand tons of ore has been blocked out by test conducted thus far which should average about [illegible] lbs of ore containing columbite per ton of mixed run gravel.

3. The proposed work for which a loan would be required is for the installation, buying [illegible] machinery, mining the gravel etc. This plant would contain all necessary screening equipment, jigs and concentrating tables such as used in placer operations.

   The cost of such a plant, including excavating equipment, and trucks has been estimated would be about [illegible],973.00. The plant would have a capacity of [illegible] tons.

   Operating costs have been estimated at [illegible]150.00 per day for 8 hour shift. This includes labor, taxes, and plant depreciation.

   Recovery of concentrates - columbite and rare earths are based at [illegible] per ton of back run gravel or [illegible] per day.

   Explored ore in place has been estimated at 20,000 tons.

   a. Map of explored area enclosed.
   b. List of major equipment:

1 - Caterpillar tractor complete with loader and excavating attachment.	18,000.00
1 - 6 ton truck	5,100.00
Jig, flotation cells, conveyors, screening tables, motors, installation and freight.	19,373.00
Total	[illegible],973.00

   c. Water facilities are enough for 100 ton plant.
   d. [illegible] drivers, caterpillar operator, 2 unskilled labors, and 1 foreman.
   e. Labor available in area. Housing available also. (Modern facilities)
   f. Location of mill [illegible], N. M. Distance 2.3 miles from property to mill on a good dirt road. Transportation by truck.
   g. Production of finished product about 600 lbs daily.
   h. 30 days will be required to erect and get plant ready.
   i. Trucks can drive into property, no roads have to be built.
   j. The price of the two combined concentrates, columbite and tantalite of mine grade is at 1.25 per pound f.o.b Santa Fe, N. M.

4. Ore Reserves

a. Measured ore 12,000 tons of 2/5 of 1 percent average or 8 lbs to a ton. of mineral columbite.

b. Measured approximate Indicated ore 8000 tons, same as above.

c. inferred ore 15,000 tons and grade of 1/3 of 1 percent.

5. General Geological Report of area by Bureau of Mines, Socorro, N.M. Will have one ready by Dec. 1st, 1950 (Sampling of mines)
6. Mining Corporation now actively engaged in exploration work. Present management employed previously by large mining company.
7. Additional data:

Samples	Area	Assayer	Cb205	Ta205	Combined Oxides

My dear Mr. Kaiser:

Your letter of October 7 to our Mr. John H. Soule' has been referred to me for an answer. In regard to placers in the Petaca Mining District of Rio Arriba County, New Mexico, Mr. Soule' suggests that you read the report in Mr. Koschmann's files on the St. Christopher Columbite Placer, Docket DMA-1113. This report was written by Mr. John N. Faick of the Geological Survey and Mr. Soule', and gives sampling data, etc., on a placer deposit in the Petaca area.

Sincerely yours,

Walter R. Storms, Chief

Re: Loan - Placer Deposit
Rio Arriba County, New Mexico
Columbite - DMA-1113

Dear Mr. Terris:

Your application of May 2, 1951, for a development loan in the sum of $34,973, DMA-1113, has been carefully reviewed by the Minor and Rare Metals Branch of the Supply Division.

We regret to advise that your application must be denied at the present time because potential reserves are insufficient to justify the requested loan.

If your explorations encounter other areas of greater potentiality, we should be glad to be advised.

Yours very truly,

Tom Lyon

Subject: Weekly Report - June 4-8, 1951

NEW MEXICO FIELD OFFICE

DMA-1113 - St. Christopher Mining and Milling Co. of American, Inc. - applicant. St. Christopher and St. John Tantalite, Columbite, and Rare Earth Placers, Petaca Mining District, Rio Arriba County, New Mexico.

The entire week was spent in concentrating 40 samples taken of the St. Christopher and St. John placers. All of the samples with 3 exceptions contained over one pound of non-magnetic concentrate per ton of sample. Tantalite as well as monazite was noted in the samples. Five selected samples were sent to Ledoux & Co. in New York for tantalum and columbium analyses. This was specified in the docket.

The report will be submitted upon receipt of sample analyses.

Time spent on DMA-1113: John H. Soule', 52 hours; W. L. Dare, 56 hours; Helen E. Soule' 0 hours.

From: Silver City, New Mexico Field Office, Box 1060, Silver City, N. Mex.

Subject: Hazen's St. Christopher Mining & Milling Corp. memo (DMR Docket 1113, Rio Arriba County, N. Mex.).

Thank you for the information contained in Hazen's memo on the St. Christopher Tantalite-Columbite and Rare Earth Placers in northern New Mexico.

We examined this property a month ago and have been unable to complete our report because of the lack of sample analyses.

The information on the spectographic work and other analyses is very welcome, and also the hint of personnel change in the company may be the reason we were unable to contact one of the former corporation officials.

Denver, Colorado

W. M. Traver, Jr. W.M.T. June 21, 1951

S. W. Hazen, Jr.

St. Christopher Mining and Milling Co.

While talking with Richard S. Bloss, Jr., lawyer, Wiley Building, Del Norte, Colorado about their perlite deposit he mentioned another company property in New Mexico.

This is a columbite-tantalite placer deposit located northwest of Petaca, New Mexico. This is about 40 miles south of the Colorado border on U. S. 285. The company has done some test pitting on this deposit but nothing sufficient to determine its extent or value.

Bloss has seen the deposit and describes it as occurring in shallow, 4-foot, overburden material along gentle slopes of an arid country. He says he has found the columbite-tantalite sand over a distance of 1/4 mile involving two intermittent stream drainage areas, but he did not attempt to find the boundaries of the occurrence. He describes the ore as black sand from the size of golf balls down to fine sand grains. There may be some natural concentration due to wind as the country is arid and little water available.

Two sample assay returns were shown to me and I copied them. These were from black sand shoveled up from natural concentrations behind rocks and in gullies. Bloss hesitates to even consider them as typical samples because he does not believe the men doing the sampling were qualified to take accurate samples. A large sample was reported to have been taken and then quartered down to the few pounds shipped.

The first sample was sent to Kennametal and they reported as follows:

	percent
Cb_2O_5	51.93
Ta_2O_5	22.35
Fe_2O_3	6.03
TiO_2	3.01

WO_3 is given as 0.75% which is quite high and classed as an impurity.

Spectrographic		
Cb	major constituent	
Ta	major constituent (low)	
Mn	minor constituent	
Fe	minor constituent	
Ti	minor constituent	
Al	trace (high)	
Ca	trace (high)	
Si	trace (high)	
Zr	trace (high)	
W	trace (high)	
Na	trace (high)	
Mg	trace	---
Sn	trace	---
U	nil	---

SWH/m

The second sample was sent to the Colorado Assaying Company. Their return showed:

Tantalum Pentoxide	8.84%
Columbium Pentoxide	48.28%
Iron Oxide (ferrous)	13.75%
Manganese	8.78%
Tin Oxide	trace
Titanium Dioxide	4.85%
Uranium Oxide (U_3O_8)	1.26%

Note: A small percentage of rare earth elements are present.

The Colorado Assaying Company returned a portion of the head sample which was not used. Mr. Bloss gave this to me for our use as a sample. He would like to have a report of the contents as found by the U. S. Bureau of Mines laboratory.

Examination of the property can be made by contacting Edward J. Turner, Jr., 1502 Sunset Road, Albuquerque, New Mexico. The former contact man Mr. Joseph A. Torres is no longer associated with the company according to Bloss.

The area to be examined can be reached by jeep or truck. A jeep is more practical as it could be used to drive over the ground.

The Kennametal company offered to buy the product at 90¢ per pound with settlement to be based on 2000 pound lots.

The General Services Administration has been contacted a few months ago and will purchase but want a reputable engineering report on the extent of the deposit etc.

The company would need financial assistance to proceed with development of the property.

Scott W. Hazen, Jr.

Memorandum

To: W. R. Storms, Tucson, Arizona June 11, 1951

From: Silver City, New Mexico Field Office

Subject: DMA-1113, St. Christopher Tantalite placers.

As you suggested Friday, I called Denver to see what could be done about analysing the samples referred to above. The only one I could talk to was Christensen and he felt that we could stand $50 more or less for assaying. Therefore, I selected 5 samples and sent them to Ledoux. These may cause further delay in the report if the results indicate the remaining 32 samples should be analysed.

Memorandum

To: W. R. Storms
C. A. Anderson

From: Field Team, Region IV

Subject: DMA-1113, St. Christopher Columbite Placer, Petaca District, Rio Arriba County, New Mexico. Joseph A. Terris, President and Manager, Applicant.

Enclosed is the brochure on the above application from Joseph A. Terris, 809 Hardy Avenue, Albuquerque, New Mexico, for $34,970 to erect a plant to recover columbite from gravels.

You will note that we have been instructed to give the investigation high priority and that samples are to be sent direct to Ledoux and Company in New York. A preliminary appraisal of adjoining area is requested in order to determine whether sampling should be extended.

Re: St. Christopher Columbite Placer
Petaca District, N.M. - DMA-1113

REGIONAL DIRECTOR'S OFFICE
REGION IV
1951
BUREAU OF MINES
DENVER, COLORADO

Dear Mr. East:

We are referring this application to your office for appropriate investigation and will so advise the applicant Mr. Joseph H. Torris, 809 Hardy Avenue, Albuquerque, N. M.

You will find herewith the following enclosures, ~~which may be~~ retained by your office.

(a.) Two copies of undated application report signed by J. A. Torris
(b.) One print each of plan maps showing location of pits and sampling results, scale 1" = 50 ft. dated October 28, 1950 and November 3, 1950.

Applicants Proposal

The applicant states he has tested by means of shallow pits approximately 20,000 tons of gravel and eluvial material containing a few pounds of columbite per ton; in addition he estimates 15,000 tons averaging about 2.4 lb. per ton. The supporting data show the location of nearly 200 test pits, with corresponding sample results. The deposit appears to consist of hillside eluvial gravels, with depth of detrital cover averaging approximately two or three feet.

A loan of $34,970.00 is requested to equip the property for operation; the figure includes $19,373 for washing plant and jigs to treat the gravels and $16,600 for trucks and excavating equipment.

Comments of the Committee

If this property contains anything like the reserves and values of columbite claimed, it deserves consideration and action by DMA to bring out this production. The ore reserve figures, while probably very optimistic, suggest the possibility of getting something in the order of 150,000 lbs. of acceptable grade columbite concentrates from this property. The combined

pentoxide grade is given as plus 55%, though the few analyses given may be misleading. Because of the unprecedented demand for columbite in the rearmament program, it is our understanding that Electro-Metallurgical Division of Union Carbide will accept material as low as 50% combined pentoxides, or possibly even less.

The field team is instructed to give this examination a high priority. Samples for analyses should be sent direct to Ledoux & Company in New York. Kindly advise also if your judgment of the sampling should be extended into adjoining areas so as to increase the potential yardage and production possibilities.

Yours very truly,

Tom Lyon
