HYDROLOGIC DATA FOR URBAN STUDIES IN THE SAN ANTONIO, TEXAS, METROPOLITAN AREA 1979-80

by
Roberto Perez
U. S. Geological Survey

INTRODUCTION

Hydrologic investigations of urban drainage basins in Texas were begun by the U.S. Geological Survey in 1954. These studies are now in progress in Austin, Houston, and San Antonio. Studies were completed in the Fort Worth metropolitan area at the end of the 1977 water year, and in the Dallas metropolitan area at the end of the 1979 water year.

The Geological Survey, in cooperation with the Texas Department of Water Resources, expanded the existing streamflow network in the San Antonio metropolitan area in May 1968 to begin urban hydrology studies in this area. In September 1968, the program was further expanded to include the collection of water-quality data.

The operation and maintenance of stations 08178000, San Antonio River at San Antonio; 08178700, Salado Creek (upper station) at San Antonio; and 08178800, Salado Creek (lower station) at San Antonio are funded by the San Antonio River Authority in conjunction with the Texas Department of Water Resources and the U.S. Geological Survey.

The operation and maintenance and collection of water-quality data at station 08178720, Lorence Creek at Thousand Oaks Blvd., San Antonio, station 08178640, West Elm Creek at San Antonio, and station 08178645, East Elm Creek at San Antonio, are funded by the Edwards Underground Water District in cooperation with the Texas Department of Water Resources and the U.S. Geological Survey. Station 08178640, West Elm Creek at San Antonio, and station 08178645, East Elm Creek at San Antonio will provide hydrologic data on similar and adjacent watersheds. The West Elm watershed is still predominately rural but is undergoing extensive urbanization in some areas. The East Elm watershed is relatively stable and undeveloped.

The objectives of the San Antonio urban hydrology study are:

1. To provide data showing the effects of various stages of urbanization on flood discharge and runoff.
2. To provide water-quality data on surface-water runoff from floods of various magnitudes, during all seasons of the year from areas with different types of urban development.

Annual publication of the San Antonio urban studies was initiated in 1969.

A defination of terms related to streamflow, water quality, and other hydrologic data, as used in this report, are defined in the U.S. Geological Survey's 1979 and 1980 "Water resources data for Texas" reports.

Purpose and Scope of this Hydrologic-Data Report

The purpose of this report is to present a compilation of hydrologic data collected by the U.S. Geological Survey in the San Antonio urban area for the 1979 water year (Oct. 1, 1978 to Sept. 30, 1979), and the 1980 water year (Oct. 1, 1979 to Sept. 30, 1980).

To facilitate the publication and distribution of this report certain material has been included that does not conform to the formal publication standards of the U.S. Geological Survey.

Watershed Features

The natural hydrologic features of watersheds in the San Antonio urban study are strongly affected by two physiographic regions, the Edwards Plateau and the West Gulf Coastal Plain, which are divided by the Balcones Escarpment (fig. 1).

The Edwards Plateau has been eroded by streams into relatively steep and rugged topography, while the West Gulf Coastal Plain, which is rolling or moderately hilly near the Balcones Escarpment, has a more gentle relief in the southern part of the study area.

The recharge zone of the Edwards underground reservoir, as presented in chapter 20 of the rules of the Texas Department of Water Resources, is that area where surface water has the potential of entering the Edwards aquifer.

A summary of flood-hydrograph partial-record stations and continuous recording gaging stations and their watershed characteristics is given in table 1.

Climate

The climate of the area is modified subtropical with a prevailing south wind. Thunderstorms occur frequently in the spring and summer. Long-duration low-intensity storms triggered by southward-moving cold fronts occur during the fall and winter. Some of the heaviest rainfall occurs in late summer and early fall as a result of hurricanes moving inland from the Gulf of Mexico. Individual storms may cause serious flooding during any season but are most frequent in the spring. The normal rainfall for San Antonio, based on records of the National Oceanic and Atmospheric Administration, Enviromental Data Service for the period 1941-70, is 27.54 inches, with the largest average monthly rainfall occurring in May and September. The average annual temperature is 69°F (20.5°C).

HYDROLOGIC INSTRUMENTATION

A partial list of gaging stations used in this report and the watershed characteristics at each of these stations are given in table 1. The locations of all hydrologic instrument installations for the San Antonio metropolitan area are shown on figure 1.

In addition to the staions listed in table 1, four flood-profile partial-record stations are located between the upper and lower stream-gaging stations on Salado Creek. In December 1972 and January 1973, seven flood-profile partial-record stations were installed at the request of the Corps of Engineers at sites on rectified channels of the San Antonio River and selected tributaries above the mouth of Salado Creek. Flood elevations for the flood-profile partial-record stations on Salado Creek and the San Antonio River are listed in tables 3 and 4.

DATA COLLECTION

Precipitation

Total precipitation and rainfall intensities were determined from 21 recording rain gages distributed throughout the study area (fig. 1). Daily and monthly precipitation is also shown for the rain gage at the San Antonio International Airport. Precipitation data for these rain gages are given in the section "Compilation of data."

Precipitation amounts in each drainage basin were compiled on a daily basis. A digital computer was used to process the large amounts of precipitation and runoff data. Precipitation at individual gages and weighted precipitation in each drainage basin for selected storms are given in the section "Compilation of data."

Rainfall for each basin was weighted by the Thiessen polygon method as described by Linsley, Kohler, and Paulhus (1949). The factors used to determine weighted-mean precipitation for each drainage basin are given in table 2. For example, the weighted-mean precipitation for the drainage basin upstream from the Olmos Creek at Dresden Drive station could be computed as follows: Multiply the recorded precipitation at rain-gage 1-Ø by 0.34; to that value, add the recorded precipitation at rain-gage 2-Ø, multiplied by 0.18; to that value, add the recorded precipitation at rain-gage 3-Ø, multiplied by 0.40; and to that value, add the reocrded precipitation at rain-gage 4-Ø, multiplied by 0.08.

Runoff

For the 1979 water year, runoff data from the San Antonio urban study area are based on discharge measurements and stage records at six continuous-record stream-gaging stations, seven flood-hydrograph partial-record stations, and water-surface elevations at eleven flood-profile partial-record stations. For the 1980 water year, one additional flood-hydrograph partial-record station is included. Daily discharge records for the six continuous-record stations and annual maximum discharge at the flood-hydrograph partial-record stations are given in the section "Compilation of data." Elevations for selected floods at four flood-profile partial-record stations and two stream-gaging stations are given in tables 3 and 4, and at seven flood-profile partial-record stations and one stream-gaging station in tables 5 and 6.

SUMMARY OF DATA FOR THE 1979-80 WATER YEARS

Annual

The average rainfall for the 1979 water year was determined from 21 rain gages and for the 1980 water year from 19 rain gages. The average rainfall in the San Antonio urban study area for the 1979 water year was 35.14 inches and for the 1980 water year it was 25.65 inches. Rainfall at the National Weather Service station located at the San Antonio International Airport was 38.79 inches for the 1979 water and 23.40 inches for the 1980 water year. Mean-annual precipitation at the National Weather Service station (at airport) for the 30-year period 1941-70 (calendar year) is 27.54 inches.

Runoff was compared with the long-term average at two selected stations. During the 1979 water year, runoff at station 08178000, San Antonio River at San Antonio, was 198 percent of the 54-year average of 56.1 ft^3/s. Runoff for station 08178800, Salado Creek (lower station) at San Antonio, was 140 percent of the 19-year average 43.1 ft^3/s. During the 1980 water year, runoff at station 08178000, San Antonio River at San Antonio, was 70 percent of the 55-year average of 55.8 ft^3/s. Runoff for station 08178800, Salado Creek (lower station) at San Antonio, was 81 percent of the 20-year average of 42.7 ft^3/s.

Individual Storms

Storms producing the highest peak discharge in the San Antonio metropolitan area during the 1979 water year occurred on the following days: November 5-6, 26, and December 31, 1978; January 10, March 15, 20-21, April 20-21, 29, June 1, 5, and July 5, 1979. During the 1980 water year, peak discharge occured on May 18, August 10-11, and September 6-7, 1980. These storms produced a variety of rainfall amounts, intensities, durations, and distributions in the drainage basins. Weighted-storm rainfall for these storm periods at areas upstream from continuous-record streamflow stations and from selected flood-hydrograph partial-record stations are given in tables 7 and 8. Storm rainfall and runoff records are given in the section "Compilation of data."

Individual storms are not given for two stations during the 1979 water year. Storm rainfall data for station 08178800, Salado Creek (lower station) at San Antonio, and 08181400, Helotes Creek at Helotes were not analyzed because the unit runoff factor for the period of streamflow was low and not representative of basin conditions during flood runoff.

For the 1980 water year, individual storms are not given for the continuous-record stream-flow station because of the absence of major storms in the study area. Similarily, no individual storms are given for 08177600, Olmos Creek tributary at Shavano Park, 08178690, Salado Creek at Bitters Road, and 08181000, Leon Creek tributary at FM 1604. Individual storms given for the 1980 water year occurred on small, well-developed basins.

WATER QUALITY

The purpose of the San Antonio urban area water-quality program is to determine the variations of water quality under various hydrologic conditions for a period of 10 years or more. At the end of the data-gathering period, the results will be summarized and the water-quality variations will be evaluated. Urban planners can then use the results to help predict and better manage the water quality of the streams, reservoirs, and Edwards aquifer in the San Antonio area.

During the 1979 and 1980 water years, water-quality data were collected at 14 locations in the San Antonio urban area (figure 1). About five sets of waterquality samples were collected during storms at each site by Geological Survey personnel. When possible, sample bottles were filled by depth integration and insitu field readings were taken at points near the centroid of flow. When streams could not be waded safely, samples were collected at points near the bank in a few feet of water.

For each set of samples, dissolved oxygen, water temperature, and pH were determined at the time of collection. Specific conductance, carbonate, bicarbonate, and bacteria concentrations were determined within 6 hours of collection. Physical parameters, biochemical oxygen demand, total organic carbon, nutrients, MBAS (methylene blue active substances), and major ions were preserved and analyzed later.

The number of bacteria present in a water sample are reported as colonies per 100 milliliters of sample. Each individual plate count must be within a specified range of colonies (20 to 60 colonies for fecal coliform and 20 to 80 colonies for fecal streptococci) to be statistically valid. Those plate counts which do not fall within the specified range are based on "nonideal colony counts" and reported. The colony counts per 100 milliliters are footnoted with a "k" in the tables.

During the 1979 water year, water-quality samples were collected on the following days: January 10-11, February 23, March 15, 21-22, April 20-21, 29, June 1, and July 5, 18. During the 1980 water year, water quality samples were collected on December 28-31, and May 15. The analytical results for each set of samples can be compared to the magnitude of the peak discharge and the time of occurrence of storms. Time and discharge data for the respective storm peaks are given in the water discharge records section of each station under "Extremes for current year."

GUADALUPE RIVER BASIN

08178000 SAN ANTONIO RIVER AT SAN ANTONIO, TX

LOCATION.--Lat 29°24'34", long 98°29'41", Bexar County, Hydrologic Unit 12100301, on left bank 193 ft (59 m) downstream from South Alamo Street Bridge in San Antonio, 2.1 mi (3.4 km) upstream from San Pedro Creek, and 230.6 mi (371.1 km) upstream from mouth.

DRAINAGE AREA.--41.8 mi² (108.3 km²). Flow of river comes from intermittent spring flow and from arteeian wells; drainage area of streams not applicable.

WATER-DISCHARGE RECORDS

PERIOD OF RECORD.--December 1895 to June 1906 periodic discharge measuremente only, January 1915 to November 1929, February 1939 to current year. Ground-water discharge into river is discussed by Petit and George, Texee Board of Water Engineers Bull. 5608, vol. 1 (1956, p. 45).

REVISED RECORDS.--WSP 1312: 1917. WSP 1923: Drainege area. WRD TX-72-1: 1971(m).

GAGE.--Water-stege recorder and concrete control. Datum of gage is 605.26 ft (184.483 m) National Geodetic Vertical Datum of 1929. Jan. 26, 1915, to Feb. 27, 1916, nonrecording gage at eite 1.3 mi (2.1 km) upstream at different datum. Feb. 28, 1916, to Apr. 7, 1920, nonrecording gage at eite 1.1 mi (1.8 km) upstream at different datum. Apr. 8, 1920, to Nov. 16, 1929, and Feb. 15, 1939, to Apr. 25, 1967, water-stage recorder in vicinity of South Alamo Street Bridge at 7.00-foot (2.134 m) higher datum. Apr. 25, 1967, to May 13, 1969, water-stage recorder at site 307 ft (94 m) downstream et same datum.

REMARKS.--Water-discharge records good. Floodflow is regulated by Olmoe flood-control reservoir, capacity 15,500 acre-ft (19.1 hm³) about 8.5 mi (13.7 km) upstream. Dam completed in 1926. Springs emerge intermittently from the Edwards and associated limestones along the Balcones Fault Zone. City of San Antonio rain gage and gage-height telemeters at station.

AVERAGE DISCHARGE.--54 years, 56.1 ft³/s (1.589 m³/s), 18.23 in/yr (463 mm/yr), 40,640 acre-ft/yr (50.1 hm³/yr).

EXTREMES FOR PERIOD OF RECORD.--Maximum discharge, 15,300 ft³/s (433 m³/s) Sept. 10, 1921, gage height, 20.14 ft (6.139 m), from floodmark, at former site and datum, from rating curve extended above 2,000 ft³/s (56.6 m³/s) on basis of slope-area measurement of peak flow; no flow at times due to regulation.
Maximum stage since 1819, that of Sept. 10, 1921.

EXTREMES OUTSIDE PERIOD OF RECORD.--Flood of July 5, 1819, equaled or exceeded that of Sept. 10, 1921.

EXTREMES FOR CURRENT YEAR.--Maximum discharge, 3,340 ft³/s (94.6 m³/s) June 1, gage height, 12.41 ft (3.783 m); no flow at times due to regulation.

DRAINAGE AREA.--137 mi² (355 km²).

WATER-DISCHARGE RECORDS

PERIOD OF RECORD.--September 1960 to current year.

GAGE.--Water-stage recorder with concrete control. Datum of gage is 684.60 ft (208.666 m) National Geodetic Vertical Datum of 1929.

REMARKS.--Water-discharge records good. No known diversion above station. Recording rain gage located at station with four additional recording rain gages located in watershed. Flow is effected at times by discharge from flood-detention pools of seven floodwater-retarding structures with combined detention capacity of 17,390 acre-ft (21.4 hm³). These structures control runoff from 48.4 mi² (125.4 km²) above this station.

AVERAGE DISCHARGE.--19 years, 10.3 ft³/s (0.292 m³/s), 1.02 in/yr (26 mm/yr), 7,460 acre-ft/yr (9.20 hm³/yr).

EXTREMES FOR PERIOD OF RECORD.--Maximum discharge, 24,900 ft³/s (705 m³/s) May 12, 1972, gage height, 15.22 ft (4.639 m), from rating curve extended above 8,000 ft³/s (227 m³/s) on basis of slope-area measurement of peak flow; no flow at times.

EXTREMES OUTSIDE PERIOD OF RECORD.--Maximum stage since at least 1853, 23 to 24 ft (7.0 to 7.3 m) in October 1913. Flood in September 1921 reached a stage of 18 ft (5.5 m), and flood of Sept. 27, 1946, reached a stage of 18.2 ft (5.55 m), and are the highest since 1899.

EXTREMES FOR CURRENT YEAR.--Peak discharges above base of 250 ft³/s (7.08 m³/s), revised, and maximum (*):

Apr. 25, 1967, to May 13, 1969, water-stage recorder at site 307 ft (94 m) downstream at same datum.

REMARKS.--Records good. Floodflow is regulated by Olmos flood-control reservoir, capacity 14,240 acre-ft (17.6 hm³), revised, about 8.5 mi (13.7 km) upstream. Dam completed in 1926 and rebuilt in 1980. Springs emerge intermittently from the Edwards and associated limestones along the Balcones Fault Zone. City of San Antonio rain gage and gage-height telemeters at station.

AVERAGE DISCHARGE.--55 years, 55.8 ft³/s (1.580 m³/s), 18.13 in/yr (461 mm/yr), 40,430 acre-ft/yr (49.9 hm³/yr).

EXTREMES FOR PERIOD OF RECORD.--Maximum discharge, 15,300 ft³/s (433 m³/s) Sept. 10, 1921, gege height, 20.14 ft (6.139 m), from floodmark, at former site and datum, from rating curve extended above 2,000 ft³/s (56.6 m³/s) on basis of slope-area measurement of peak flow; no flow at times due to regulation.
Maximum stage since 1819, that of Sept. 10, 1921.

EXTREMES OUTSIDE PERIOD OF RECORD.--Flood of July 5, 1819, equaled or exceeded that of Sept. 10, 1921.

EXTREMES FOR CURRENT YEAR.--Maximum discharge, 2,440 ft³/s (69.1 m³/s) May 1 at 1845 hours, gage height, 11.23 ft (3.423 m); minimum daily, 0.86 ft³/s (0.024 m³/s) May 5, due to reguletion.

LOCATION.--Lat 29°30'57", long 98°25'51", Bexar County, Hydrologic Unit 12100301, on upstream side of upstream bridge of two bridges on Interstate Highway 410 in San Antonio, 1.0 mi (1.6 km) west of Northeast School, 1.1 mi (1.8 km) upstream from Perrin-Beitel Creek, and 2.7 mi (4.3 km) east of San Antonio International Airport.

DRAINAGE AREA.--137 mi² (355 km²).

PERIOD OF RECORD.--September 1960 to current year.

GAGE.--Water-stage recorder with concrete control. Datum of gage is 684.60 ft (208.666 m) National Geodetic Vertical Datum of 1929.

REMARKS.--Records poor. No known diversion above station. Recording rain gage located at station with four additional recording rain gages located in watershed. Flow is affected at times by discharge from flood-detention pools of nine floodwater-retarding structures with combined detention capacity of 24,460 acre-ft (30.2 hm³). These structures control runoff from 67.7 mi² (175.3 km²) above this station.

AVERAGE DISCHARGE.--20 years, 9.94 ft³/s (0.282 m³/s), 0.98 in/yr (25 mm/yr), 7,200 acre-ft/yr (8.88 hm³/yr).

EXTREMES FOR PERIOD OF RECORD.--Maximum discharge, 24,900 ft³/s (705 m³/s) May 12, 1972, gage height, 15.22 ft (4.639 m), from rating curve extended above 8,000 ft³/s (227 m³/s) on basis of slope-area measurement of peak flow; no flow at times.

EXTREMES OUTSIDE PERIOD OF RECORD.--Maximum stage since at least 1853, 23 to 24 ft (7.0 to 7.3 m) in October 1913. Flood in September 1921 reached a stage of 18 ft (5.5 m), and flood of Sept. 27, 1946, reached a stage of 18.2 ft (5.55 m), and are the highest since 1899.

EXTREMES FOR CURRENT YEAR.--Maximum discharge, 232 ft³/s (6.57 m³/s) Sept. 6, time unknown, gage height, 4.36 ft (1.329 m), from floodmark, no peak above base of 250 ft³/s (7.08 m³/s); no flow at times.
