STUDIES RELATED TO WILDERNESS

The Wilderness Act (Public Law 88-577, September 3, 1964) and related acts require the U.S. Geological Survey and the U.S. Bureau of Mines to survey certain areas on Federal lands to determine their mineral resource potential. Results must be made available to the public and be submitted to the President and the Congress. This report presents the results of a geochemical survey of the Bald Rock, Bucks Lake, Chips Creek, and Middle Fork Feather River Roadless Areas in the Lassen and Plumas National Forests, Butte and Plumas Counties, California. Bald Rock, Buck Lake, Chips Creek, and Middle Fork Feather River were classified as further planning areas during the Second Roadless Area Review and Evaluation (RARE II) by the U.S. Forest Service, January 1979.

INTRODUCTION

Bald Rock (5169), Bucks Lake (5168), Chips Creek (5099), and Middle Fork Feather River (5167) Roadless Areas occupy 66,450 acres on the west slope of the Sierra Nevada near Quincy, Calif. (fig. 1; note that Middle Fork Feather River and Bald Rock boundaries include areas designated as Wild and Scenic River). Bucks Lake and Chips Creek Roadless Areas are separated by the North Fork of the Feather River; Bald Rock and Middle Fork Feather River Roadless Areas are along the Middle Fork of the Feather River. The geology of the roadless areas has been summarized briefly by Sorensen and Pietropaoli (1982a, 1982b).

The roadless areas are underlain by Paleozoic and Mesozoic metasedimentary, metavolcanic, and ultramafic rocks that have been intruded by Mesozoic plutons and partially covered by flat-lying Cenozoic volcanic rocks. The metamorphic and ultramafic rocks crop out in northwest-trending fault-bounded belts. The easternmost belt consists of the continentally derived sediments of the Shoo Fly Formation. The Shoo Fly is Ordovician(?) to Devonian(?) in age, consists of phyllite with interbedded fine grained quartzite, and is bordered on the west by ultramafic rocks coincident with the Melones fault zone. West of the Melones fault zone are several sequences of Upper Paleozoic and Lower Mesozoic metasedimentary and metavolcanic rocks (Hietanen, 1981). The easternmost of these is the Calaveras Formation, a dominantly metasedimentary unit of Pennsylvanian age. West of the Calaveras is the Franklin Canyon Formation, a series of mainly metavolcanic rocks considered to be Triassic(?) and Late Paleozoic in age. The westernmost sequence of Upper Paleozoic rocks is the Permian(?) Horseshoe Bend Formation, consisting of interbedded and possibly tectonically interleaved metasedimentary, metavolcanic, and ultramafic rocks.

The metasedimentary, metavolcanic, and ultramafic rocks were intruded by quartz diorite (nomenclature of Peterson, 1961) plutons during middle and late Mesozoic time. The area was elevated, eroded, and to some degree covered by volcanic deposits by late Tertary time. In places, the Tertiary volcanic rocks cover early Tertiary streambed gravels that locally contain placer gold.

ANALYTICAL DATA

Rock samples and stream-sediment concentrates were collected for semiquantitative emission spectrographic analysis (see figs. 2 and 3 for

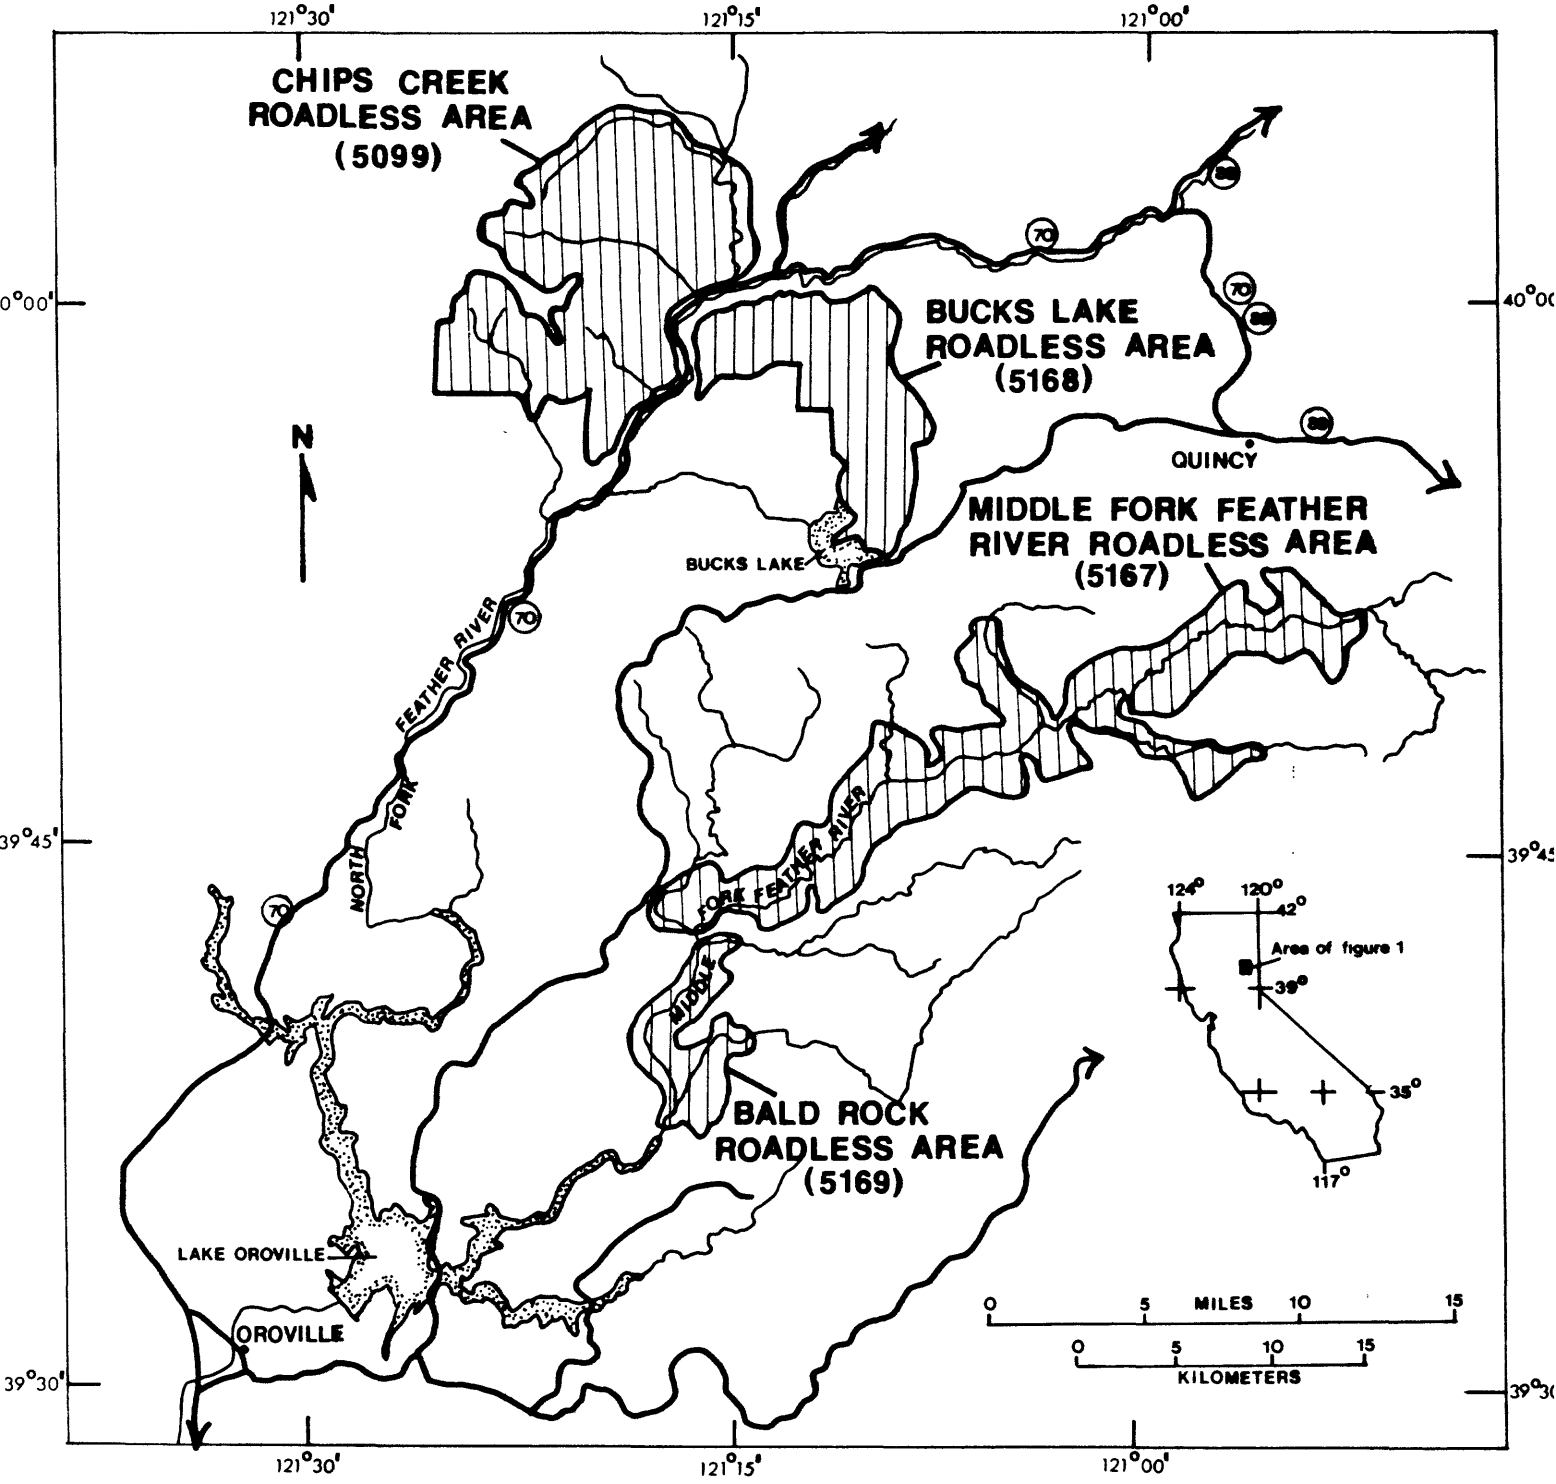

Figure 1.--Index map showing Chips Creek, Bucks Lake, Middle Fork Feather River, and Bald Rock Roadless Areas.

locations). Selected samples were analyzed for gold and platinum-group metals using atomic-absorption and fire-assay methods. Fresh representative bedrock samples from each unit were collected. Stream-sediment samples were collected from sandy material close to the bank and concentrated by panning away organic material and light minerals until about 10 percent of the original volume remained. All samples were collected during 1980 and 1981 by Henry Pietropaoli, M. L. Sorensen, and E. B. Yates.

Sample preparation and analytical procedure

Rock samples were crushed to 6 mm (0.25 in.), split, and pulverized prior to analysis for 31 elements (listed in table 1) by standard semiquantitative emission spectrography following the techniques outlined in Grimes and Marranzino (1968). Quartz veins within ultramafic rocks were analyzed additionally for gold by atomic absorption following the methods of Ward and others (1969). Stream-sediment-concentrate samples were dried, sieved to minus 80-mesh, and split. They were then separated into heavy and light fractions using bromoform, and magnetic minerals removed using a hand magnet or a Frantz Isodynamic separator. Most of the concentrates were analyzed by semiquantitative emission spectrography for 30 or 31 elements (elements are listed in table 2; scandium was not analyzed in some samples). A small number of the stream-sediment concentrates were analyzed by fire assay for gold and platinum-group metals (listed in table 2) following the methods of Haffty and others (1977). Spectrographic atomic absorption and fire assay analyses were performed by E. L. Mosier, J. Motooka, Steve Sutley, R. R. Carlson, E. F. Cooley, and R. T. Hopkins at the U.S. Geological Survey in Denver, Colo.

Data

Analytically determined abundances for all elements are reported in parts per million, except for Ca, Fe, Mg, and Ti, which are given as percentages. Table 4 lists the trace element analyses for 157 rock samples and table 5 lists the trace element analyses for 454 stream-sediment concentrates. Rock type and formation or unit, coded in the first two columns of table 4 for each sample, are listed in table 3. Elements not reported present above the lower determination limits given in tables 1 and 2 were omitted from table 4 and 5. Semiquantitative spectrographic analyses are reported as the midpoints of a six-step geometric interval whose boundaries are 0.12, 0.18, 0.26, 0.38, 0.56, 0.83, 1.2, and so on, and whose midpoints are 0.15, 0.2, 0.3, 0.5, 0.7, 1.0, and so on. The precision of these values is approximately plus or minus one interval at 68 percent confidence or two intervals at 98 percent confidence (D.J. Grimes, oral commun., 1980) Atomic-absorption and fire-assay methods are quantitative and values are reported as discrete values.

Analytical data are stored in the U.S. Geological Survey RASS system (Rock Analysis Storage System) (Van Trump and Miesch, 1976). STATPAC (STATistical PACkage) files were generated for both whole-rock and stream-sediment-concentrate data using RASS program Retrieval (b860). STATPAC program Publst (Publication listing), written by J. B. Fife of the U.S. Geological Survey, was used to produce tables 4 and 5.

Table 1.--Lower limits of analytical determination for rock samples from Bald Rock, Bucks Lake, Chips Creek, and Middle Fork Feather River Roadless Areas

[Limits of determination of elements are in parts per million (ppm) except where noted. All analyses are by spectrographic methods except for atomic absorption (aa) gold]

[a]Two different detection limits were used for different batches submitted for analysis.

[b]Detection limits varied for each sample; numbers show range.

Table 3.--Code numbers used for rock types and formation or unit in the first two columns of table 4 for each sample

Rock codes
Sedimentary rocks
10 phyllite
11 marble
12 limestone
13 dolomite
14 tillite
20 quartzite
21 chert
Extrusive igneous and meta-igneous rocks
30 basalt
31 andesite
32 felsite
33 rhyolite
34 tuff
35 breccia
36 greenstone
Ultramafic and mafic rocks
40 serpentine
41 pyroxenite
42 peridotite
43 talc
44 amphibolite
45 hornblendite
Intrusive igneous and meta-igneous rocks
50 diorite
51 diabase
52 gabbro
53 quartz diorite
Gossan and quartz veins
60 gossan
61 quartz veins

Formation or unit codes
10 Shoo Fly Formation
20 Calaveras Formation
21 Franklin Canyon Formation
22 Horseshoe Bend Formation
30 Bucks Lake Pluton
31 Grizzly Pluton
32 Hartman Pluton
33 Bald Rock Pluton
34 Cascade Pluton
40 Lovejoy Formation
41 Unnamed Tertiary volcanic rocks
60 Feather River Ultramafic Body and other ultramafic and related rocks
70 Large bodies of intrusive metaigneous rocks; small bodies are given code of host unit

Table 4.--Results of rock geochemical analyses for samples from Bald Rock, Bucks Lake, Chips Creek, and Middle Fork Feather River Roadless Areas

[First two digits of sample number indicate year of collection; letters indicate collector; P, H. Pietropaoli; S, M. L. Sorensen; Y, E. B. Yates; last three digits indicate sample site. Qualifying codes in analytical data are defined as follows: N, not detected at the limit of analytical detection; <, detected, but below the lower limit of analytical determination; >, detected but above the uper limit of analytical determinaion; --, no analysis performed]

Table 5.--Results of stream-sediment nonmagnetic, heavy-mineral concentrate analyses for samples from Bald Rock, Bucks Lake, Chips Creek, and Middle Fork Feather River Roadless Areas

[First two digits of sample number indicate year of collection; letters indicate collector; P, H. Pietropaoli; S, M. L. Sorensen; Y, E. B. Yates; last three digits indicate sample site. Qualifying codes in analytical data are defined as follows: N, not detected at the limit of analytical detection; <, detected, but below the lower limit of analytical determination; >, detected but above the uper limit of analytical determinaion; --, no analysis performed]
