A computer program to convert degrees 2θ to interplanar spacings and conversion tables for Cu $K\alpha_1$, $K\alpha_2$ and weighted mean radiation

by R.F. Commeau, L.J. Poppe, and J.E. Dodd

Open-File Report 85-455

Woods Hole, Mass.

TABLE OF CONTENTS

ABSTRACT

Tables that allow conversion of degrees 2Θ to interplanar spacings for use in X-ray diffraction analysis have been generated for Cu $K\alpha_1$, $K\alpha_2$, and weighted mean X-ray radiation, using a C language computer program. This interactive program also permits the user to generate conversion tables for Cr, Co, Fe, Mo, and Ni target materials and any other X-ray radiation wavelengths. The various theoretical and practical aspects governing the selection of target materials (wavelength of emitted radiation from the X-ray tube) are also discussed.

INTRODUCTION

A computer program has been written to generate tables which allow the user to convert degrees 2Θ to interplanar spacings. The program, which was written in C language and will operate under UNIX system 5 or MS-DOS version 2.x, is interactive and prompts the user for all necessary information. Although permanently sealed X-ray tubes are generally available with Cu, Co, Cr, Fe, Mo and Ni targets, we have supplied conversion tables solely for copper radiation. While the other target materials are available, in practice they are not commonly used for X-ray diffraction analysis.

The calculation performed by the program (Appendixes 1 and 2) uses the Bragg equation to generate the conversion tables. Atoms in crystalline substances are arranged in symmetrical, repeating, three-dimensional planes. X-ray diffraction can be visualized as the reflection of incident radiation from a large number of parallel planes of atoms. The number, orientation, and spacings of these atomic planes are determined by the crystalline structure of the analyzed specimen. Bragg's law is represented by the equation:

$$n \lambda = 2d \sin \Theta$$

where n is an integer giving the order of diffraction, λ is the wavelength of the incident radiation, d (where n = 1) is the interplanar spacings of the crystal or defracting planes, and Θ, the Bragg angle, is the angle between the incident X-ray beam and the atomic planes. The wavelength of the incident radiation is dependent on the atomic number, and therefore the metallic composition, of the X-ray tube target material. The diffraction of X-rays of a given wavelength differs from reflection as in a mirror in that the reflections can not occur at all angles; the angles at which diffraction takes place must satisfy the Bragg equation.

X-rays emitted from the tube are a mixture of two distinct categories of radiation: (1) the X-ray lines characteristic of the target material and (2) the continuum or white X-rays which are present at all wavelengths or frequencies below the excitation voltage (the operating potential) of the X-ray tube (Parrish and Kohler, 1965). The characteristic X-rays generated with the above target materials include the K and L series lines. However, because of the low energy (long wavelength) of the L series, they are rapidly attenuated by air and the tube window and are not of concern here. The K lines consist of a doublet, $K\alpha_1$ and $K\alpha_2$, which have nearly the same wavelength, and a K_β line, which consists of three lines, usually unresolved, of shorter wavelength. Inasmuch as only $K\alpha$ line radiation is normally used in X-ray diffraction, the remaining radiation must be removed. The K_β lines may

be filtered out either by metal foil filters inserted in the X-ray beam to preferentially absorb a certain wavelength or band of wavelengths or by monochromatization, using crystals of known interplaner spacings in the incident or diffracted beam. The continuum (white) radiation can be filtered out with a peak-height analyzer where a diffractometer is used.

The program allows the user to select a conversion table for Cu, Co Cr, Fe, Mo, and Ni targets based on either the $K\alpha_1$, $K\alpha_2$, or a weighted mean (Philips Electronic Instruments, Inc., un-dated instruction manual) of the two $K\alpha$ lines. The X-ray wavelengths used in the program were taken from the CRC Handbook of Chemistry and Physics (Bearden, 1978). This program also contains the option to calculate $K\alpha$ or K_β conversion tables for any wavelength of X-ray radiation selected by the user. This option can be used to generate conversion tables for other, less common, target materials. The $K\alpha_1$ and $K\alpha_2$ line separation or splitting may not be resolved by most powder diffraction systems in the lower part of the 2θ range. For such unresolved reflections, the weighted mean wavelengths are calculated using the equation:

$$(2(K\alpha_1)+K\alpha_2)/3$$

This equation gives the $K\alpha_1$ lines more "weight" because of the greater intensity of the $K\alpha_1$ lines relative to the $K\alpha_2$ lines. Where $K\alpha_1$ and $K\alpha_2$ reflections are resolved, accuracies such as those shown in tables 1 and 2 may be achieved. Because of the resolution problem associated with the $K\alpha_1$ and $K\alpha_2$ doublet, some researcher prefer to use K_β radiation. K_β conversion tables may be generated by using the program option to select any wavelength of radiation. The K_β wavelengths (Bearden, 1978) for the most common target materials are given in table 3.

All calculations were done using 64-bit, double-precision, floating-point numbers as defined in the Institute of Electrical and Electronic Engineers microprocessor floating-point standard. This standard allows for 53 bits of binary precision, which translates to about 15 digits of decimal precision. This use of double precision lessens the effects of rounding errors by calculating the interplanar spacings to 15 digits before rounding the numbers off to five decimal places. Previously published X-ray diffraction conversion tables (Fang and Bloss, 1966) did not utilize double precision in their programming and, therefore, contained greater rounding errors and could not accurately generate data beyond four decimal places. Other conversion tables (Brown, 1980) did not report data to $180^\circ 2\theta$ or at $.01^\circ 2\theta$ intervals

Each target material listed above produces X-rays of characteristic energy and wavelength, making each target suitable for specific applications. Copper $K\alpha$ radiation is the most commonly used radiation for diffraction purposes owing to its relatively high peak energy, intensity, low peak-to-background ratio, convenient wavelength, high heat conductivity of the target material, and the symmetry (minimal trailing-off on the longer wavelength wide) of the $K\alpha_1$ and $K\alpha_2$ composite peaks.

When a specimen contains more than a small percentage of iron, Co or Fe $K\alpha$ radiation should be used to avoid interference (high background or film darkening) from fluorescent radiation (iron X-rays) caused by the excitation of the iron by Cu $K\alpha$ radiation. In samples that contain high percentages of iron, cobalt radiation has some advantages over that of iron because Co $K\alpha$ radiation is not as strongly absorbed, and any interfering Co K_β radiation is

INTERPLANAR SPACING SPLIT ($K\alpha_2$-$K\alpha_1$)

Cr	2.08487	Ni	1.500135
Fe	1.75661	Cu	1.392218
Co	1.62079		

Table 3. K_β wavelengths for Cr, Fe, Co, Ni, and Cu target materials from Bearden (1978).

absorbed or filtered out by the iron (Brindley, 1961). Similarly, a Ni target tube may be used to eliminate fluorescence problems associated with specimens that contain high proportions of cobalt.

Cr Kα radiation is used because of the greater resolution obtainable with the longer wavelength. Lower angle, long interplanar spacings, which would not be otherwise observable, are shifted into the measureable 2Θ range with Cr Kα radiation. However, because of its long wavelength and low energy, Cr Kα radiation is quickly absorbed, and helium- or hydrogen-filled diffraction chambers and/or slow scan rates are required. Conversely, Mo Kα radiation, because of its shorter wavelength, is used to shift the diffraction maxima resulting from high angle, shorter interplanar spacings toward the low 2Θ angles.

The conversion tables that follow show the calculated interplanar spacings to .01°.

APPENDIX A

Program Documentation

Program Name: intplanspace (for IBM PC, ipspace.exe)

Type: Main program

Purpose: To produce a table that can be used to convert degrees two theta to interplanar spacings (in Angstrom units) for any wavelength of x-ray radiation.

Machine: Pacific Microsystems 68010 (also IBM PC)

Operating System: UNIX System 5 (for IBM PC, MS-DOS vers. 2.x)

Source Language: C Programming Language

Program Category: Table Generator

Input: The investigator will be asked for the type of target element producing the radiation, which lines of the spectrum are to be used, and the range of angles to include in the output.

Output: A formatted table with headings showing the choices selected for input. The two theta angles, in .01 degree increments, are listed in the margins with the interplanar spacings, in Angstrom units, in the body of the table.

Usage: Type the program name, intplanspace, to start the process. Questions and menus are sent to the UNIX stderr - the terminal used to run the program. All input comes from the stdin device - also the terminal. The output table is sent to stdout - by default, the terminal, but in normal use, this should be redirected to a file or piped to the line printer.

To redirect the table to a file, type this to run the program:

```
intplanspace >filename
```

where 'filename' is any legal name. The 'greater than' symbol must be there. In this case, all the set up routines will still be handled through the terminal, but the table will be sent only to the file. If you know UNIX, you may also 'tee' a copy off to the terminal, but since it is formatted for a 132 column line printer, it will be hard to read.

To pipe the output table to the line printer, type this:

```
intplanspace | lpr
```

The pipe symbol '|' and the mnemonic 'lpr' must both be there for this to work. As with the redirection example above, all the set up questions and answers will still be handled through the terminal.

Detailed Usage:

After the program begins running, the following menu appears:

```
Choose one of the following elements using the
letter designation preceding it

a - chromium

b - iron

c - cobalt

d - nickel

e - copper

f - molybdenum

g - user selected wavelength

Letter: e
```

Here, the investigator has chosen 'copper' by typing the letter 'e' and hitting the carriage return. After the carriage return, the next menu appears:

```
Choose one of the three types of lines used to
compute the radiation wavelength, lambda

a - K Alpha 1

b - K Alpha 2

c - K Alpha Weighted Mean

Letter: c
```

The investigator chose 'K Alpha Weighted Mean'. The next menu allows a choice of the range of angles included in the table:

```
Do you want a full table ( 0 to 180 degrees ) or
a partial table, where you choose the range? Type
in 'a' or 'b' below.

a - Full Table

b - Partial Table

Letter: b

Start table at (integer degrees): 45

Finish table at (not including):  49
```

Detailed Usage (cont.):

After selecting a partial table, the choice was made to start the table at 45 degrees and end it at 49 degrees. Notice that only whole degrees (integers) can be entered for the last two lines. Another important point here is that the table will include values to 48.99 degrees only. If the full table had been selected, the last two questions on this menu would have been omitted and the table would have results from 0.00 degrees up to and including 179.99 degrees. The final menu is a summary of the selections the investigator has made:

```
The following parameters have been chosen:

Element Type - copper

Line type - K Alpha Weighted Mean

Lambda - 1.541838

Table range from 45 to 49 degrees

Is this correct? (yes or no) no
```

Typing anything starting with a 'y' or 'Y' will allow the program to start generating the table, but here, a 'no' has been typed, so the program restarts the set-up phase with the opening menu:

```
Choose one of the following elements using the
letter designation preceding it

a - chromium

b - iron

c - cobalt

d - nickel

e - copper

f - molybdenum

g - user selected wavelength

Letter: g

Wavelength (in Angstrom units): 1.234567
```

Detailed Usage (cont.):

This time, 'user selected wavelength' was chosen, so an additional prompt is displayed and a wavelength in Angstrom units must be typed in. Because there is no need for the investigator to select the line type, the program skips that menu and asks again for the two theta range of the table:

```
Do you want a full table ( 0 to 180 degrees ) or
a partial table, where you choose the range? Type
in 'a' or 'b' below.

a - Full Table

b - Partial Table

Letter: b

Start table at (integer degrees): 45

Finish table at (not including):  49
```

Notice that this prompt must be answered again. It isn't possible to default to the answers given the first time through.

Finally, the summary of selections is given again:

```
The following parameters have been chosen:

Element Type - user selected wavelength

Line type -

Lambda - 1.234567

Table range from 45 to 49 degrees

Is this correct? (yes or no) yes

Generating user selected wavelength Table
```

This time, an answer of 'yes' is given and the response is 'Generating ..... Table'. Since the output may take a while to to start or may be silent, this message lets the investigator know that it's out of his hands now. Upon completion, the program will terminate with a 'table finished for ... ' message.

Restrictions: When asked for single letter responses, you must be sure to type in only one letter and then a carriage return. Also, when asked to respond 'yes' or 'no', you must limit your response to five characters and there must be no blanks embedded in the answer. These restrictions are due to the way input is handled by the C programming language.

The range of the table must be from whole degrees to whole degrees. Start and stop limits cannot be given in tenths of degrees.

Both of these restrictions could be removed, with some software changes, if they prove to be major problems.

Subprograms Required: None

Storage Requirements: 22.8K Bytes (for IBM PC, 30.6K Bytes)

APPENDIX B

Program Listing

```
