

Photo 6 (fig. 8, pamphlet). **East wall of North Pass caldera**, as viewed obliquely from the south across Saguache valley (along Colorado Hwy 114). Outflow Saguache Creek Tuff (32.2 Ma) and underlying Conejos lavas and tuffs are abruptly truncated along caldera wall; then onlapped by ponded caldera-filling dacite and andesite lavas (~30 Ma) and overlying Fish Canyon Tuff (28.02 Ma).
