RESULTS OF SPIRIT LEVELING IN NEVADA, 1897 TO 1909, INCLUSIVE.

R. B. MARSHALL, Chief Geographer.

INTRODUCTION.

Scope of the work.—All results of spirit leveling in Nevada previously published by the United States Geological Survey and all the results of later work are included in this report, rearranged by quadrangles. The elevations are based on preliminary heights of bench marks along the precise level line of the Coast and Geodetic Survey from San Diego via Barstow and Goffs, Cal., to Ogden, Utah, and on the precise line of the United States Geological Survey from Mohave, Cal., to Lida, Nev.

Personnel.—The field work previous to 1903 was done under the general direction of R. U. Goode, geographer; that for 1903 to 1906, inclusive, under E. M. Douglas, geographer; that for 1907 under R. B. Marshall, geographer; and the later work under T. G. Gerdine, geographer, under the general direction of R. B. Marshall, chief geographer. The names of the various levelmen are given in the introduction to each list. The office work of computation, adjustment, and preparation of lists was done mainly by S. S. Gannett, geographer, and D. H. Baldwin, topographer, and since 1907 under the general direction of E. M. Douglas, geographer.

Classification.—The elevations are classified as precise or primary according to the methods employed in their determination. For precise level lines instruments and rods of the highest grade are used, each line is run both forward and backward, and every precaution is taken to guard against error. The allowable divergence between the forward and the backward lines in feet is represented by the formula $0.017 \sqrt{D}$, in which D is the distance in miles between bench marks. For primary lines standard Y levels are used; lines are run in circuits or are closed on precise lines, with an allowable closing error in feet represented by $0.05 \sqrt{D}$, in which D is the length of the circuit in miles, sufficient care being given to the work to maintain this

standard. For levels of both classes careful office adjustments are made, the small outstanding errors being distributed over the lines.

Bench marks.—The standard bench marks are of two forms. The first form is a circular bronze or aluminum tablet (*C* and *E*, Pl. I), $3\frac{1}{2}$ inches in diameter and one-quarter inch thick, having a 3-inch stem, which is cemented in a drill hole in solid rock in the wall of some public building, a bridge abutment, or other substantial masonry structure. The second form (*F*, Pl. I), used where masonry or rock is not available, consists of a hollow wrought-iron post $3\frac{1}{2}$ inches in outer diameter and 4 feet in length. The bottom is spread out to a width of 10 inches in order to give a firm bearing on the earth. A bronze or aluminum-bronze cap is riveted over the top of the post, which is set about 3 feet in the ground. A third style of bench mark with abbreviated lettering (*B* and *D*, Pl. I) is used for unimportant points. This consists of a special copper nail $1\frac{1}{2}$ inches in length driven through a copper washer seven-eighths inch in diameter. The tablets as well as the caps on the iron posts are appropriately lettered, and where States have cooperated in the work the fact of such cooperation is indicated by the addition of the State name (*G*, Pl. I).

The numbers stamped on the bench marks described in the following pages represent the elevations to the nearest foot as determined by the levelman. These numbers are stamped with $\frac{3}{16}$ -inch steel dies on the tablets or post caps to the left of the word "FEET." The office adjustment of the notes and the reduction to mean sea level datum may so change some of the figures that the original markings are 1 or 2 feet in error. It is assumed that engineers and others who have occasion to use the bench-mark elevations will apply to the Director of the United States Geological Survey, at Washington, D. C., for the adjusted values, and will use the markings as identifications numbers only.

Datum.—All United States Geological Survey elevations are referred to mean sea level, which is the level that the sea would assume if the influence of winds and tides were eliminated. This level is not the elevation determined from the mean of the highest and the lowest tides, nor is it the half sum of the mean of all the high tides and the mean of all the low tides, which is called the half-tide level. *Mean sea level is the average height of the water, all stages of the tide being considered.* It is determined from observations made by means of tidal gages placed at stations where local conditions, such as long, narrow bays, rivers, and like features, will not affect the height of the water. To obtain even approximately correct results these observations must extend over at least one lunar month, and if accuracy is desired they must extend over several years. At ocean stations the half-tide level and the mean sea level usually differ but little. It is

assumed that there is no difference between the mean sea level as determined from observations in the Atlantic Ocean, the Gulf of Mexico, or the Pacific Ocean.

The connection with tidal stations for bench marks in certain areas that lie at some distance from the seacoast is still uncertain, and this fact is indicated by the addition of a letter or word to the right of the word "DATUM" on tablets or posts. For such areas corrections for published results will be made from time to time as the precise-level lines of the United States Geological Survey or other Government organizations are extended.

Topographic maps.—Maps of the following quadrangles wholly or partly in Nevada have been published by the United States Geological Survey up to July 1, 1911. Maps now in stock may be obtained for 5 cents each or \$3 a hundred on application to the Director of the Survey at Washington, D. C.:

PRECISE LEVELING.

Lida 1° Quadrangle.

ESMERALDA COUNTY.

The elevations in the following list are a portion of the results of a spur line of precise levels run in the spring of 1905 by R. A. Farmer, and extend from the State line near Oasis east to Lida. For the results obtained in the continuation of this line, see Bulletin 342, "Results of Spirit Leveling in California."

The initial bench mark is an iron post stamped "2732 B," 0.4 mile south of Mohave and 25 feet north of milepost 382, the elevation of which is now accepted as 2,733.451 feet above mean sea level.

* Out of print.

¹ Amargosa region map includes Kawich sheet and parts of Ballarat, Furnace Creek, and Lida sheets.

² Lake Tahoe and vicinity map includes Carson, Markleeville, Pyramid Peak, and Truckee sheets.

PRIMARY LEVELING.

Furnace Creek, Kawich, Las Vegas, and Lida 1°, Silver Peak and White Mountain
30' Quadrangles.

ESMERALDA, LINCOLN, AND NYE COUNTIES.

The elevations in the following list are based upon an elevation at Lida determined by precise leveling of the United States Geological Survey from Mohave, upon an elevation at Las Vegas determined in 1907 by the Coast and Geodetic Survey by precise leveling of 1906-7 from San Diego, Cal., and upon primary prism level lines in California from same sources.

The leveling in part of the Lida quadrangle and in the White Mountain quadrangle was done in 1897-98 by C. R. Smith and is republished from the appendix to the Nineteenth Annual Report of the Survey. These results, which were originally based on railroad datum, have been reduced 74.8 feet. Additional leveling was done in the Lida quadrangle in 1905 and 1907 by Homer Hadley and L. F. Biggs, respectively. The leveling in the Furnace Creek quadrangle was done by Ress Philips in 1905 and by Biggs in 1907, and that in the Kawich quadrangle by Philips in the same year. The leveling in the Las Vegas quadrangle was done by Biggs in 1907.

Bridgeport 30' and Hawthorne 1° Quadrangles.

ESMERALDA COUNTY.

The elevations in the following list are based upon a bench mark at Bridgeport, Cal. The elevation used is 4 feet greater than that given in Bulletin 342, this correction being determined by leveling through Hawthorne, Nev., from Mohave, Cal. Allowance has been made for orthometric correction from Mohave, and a small correction has been applied at Mohave.

The leveling was done by C. M. Weston in 1909.

Carson Sink and Hawthorne 1° Quadrangles.

ESMERALDA, CHURCHILL, AND NYE COUNTIES.

The elevations in the following list are based upon a bench mark established at Lida by precise leveling, connection with which was obtained through primary leveling in the Lida, Silver Peak, and Tonopah quadrangles.

The leveling was done in 1907 and 1908 by T. A. Green, with the exception of that near Candelaria in the Hawthorne quadrangle, which was done in 1897 by C. R. Smith. The leveling by Smith was based on railroad datum; the bench marks are stamped 75 feet too high.
