RESULTS OF SPIRIT LEVELING IN PENNSYLVANIA, 1899 TO 1911, INCLUSIVE.

R. B. MARSHALL, Chief Geographer.

INTRODUCTION.

Cooperation.—Equal allotments of funds for the work were made by the United States Geological Survey and the Topographic and Geological Survey Commission of Pennsylvania, of which George W. McNees was chairman in 1899, 1900, and 1905 to 1911, inclusive, and J. N. Pew was chairman from 1901 to 1904, inclusive.

Previous publication.—The results of spirit leveling previously published in Bulletin 288, containing descriptions and elevations of bench marks established in Pennsylvania from 1899 to 1905, inclusive, and based on the 1903 adjustment, have been corrected to agree with the 1907 adjustment of precise leveling of the Coast and Geodetic Survey and are here republished, together with all results of spirit leveling by the United States Geological Survey since 1905. The elevations are likely to be changed but slightly by any future adjustment.

Personnel.—The field work from 1899 to 1906, inclusive, was done under the direction of H. M. Wilson, geographer, and that from 1907 to 1911, inclusive, was done under Frank Sutton, geographer. The work since January, 1908, was done under the general direction of R. B. Marshall, chief geographer. Credit is given in the heading of each list to the different levelmen. The office work of computation, adjustment, and preparation of lists was done mainly by S. S. Gannett, geographer, under the general direction of E. M. Douglas, geographer.

Classification.—The elevations are classified as precise or primary, according to the methods employed in their determination. The former are determined by lines of levels run either in both forward and backward directions or by simultaneous double-rodded lines, a high-grade instrument being used and special precautions being taken in observations and reduction to correct errors and make the line continuously good throughout. The latter or primary levels are determined with the Y level, precautions being taken against only the principal errors and the levels being run mostly in circuits of single

lines. The allowable limit of error observed on the precise work already done by the Geological Survey in this State is represented in feet by $0.03\sqrt{D}$ and that for the primary work by $0.05\sqrt{D}$, in which D is the length of circuit in miles.

Bench marks.—The standard bench marks are of two forms. The first form is a circular bronze or aluminum tablet (C and E, Pl. I), $3\frac{1}{2}$ inches in diameter and $\frac{1}{4}$ inch thick, having a 3-inch stem, which is cemented in a drill hole in solid rock in the wall of some public building, a bridge abutment, or other substantial masonry structure. The second form (F, Pl. I), used where masonry or rock is not available, consists of a hollow wrought-iron post $3\frac{1}{2}$ inches in outer diameter and 4 feet in length. The bottom is spread out to a width of 10 inches in order to give a firm bearing on the earth. A bronze or aluminum-bronze cap is riveted over the top of the post which is set about 3 feet in the ground. A third style of bench mark, with abbreviated lettering (B and D, Pl. I), is used for unimportant points. This consists of a special copper nail $1\frac{1}{2}$ inches in length driven through a copper washer $\frac{7}{8}$ inch in diameter. The tablets as well as the caps on the iron posts are appropriately lettered, and cooperation by States is indicated by the addition of the State name (G, Pl. I).

The numbers stamped on the bench marks described in the following pages represent the elevations to the nearest foot as determined by the levelman. These numbers are stamped with $\frac{3}{16}$ -inch steel dies on the tablets or post caps, to the left of the word "Feet." The office adjustment of the notes and the reduction to mean sea level datum may so change some of the figures that the original markings are 1 or 2 feet in error. It is assumed that engineers and others who have occasion to use the bench-mark elevations will apply to the Director of the United States Geological Survey, at Washington, D. C., for the adjusted values, and will use the markings as identification numbers only.

Datum.—All United States Geological Survey elevations are referred to mean sea level, which is the level that the sea would assume if the influence of winds and tides were eliminated. This level is not the elevation determined from the mean of the highest and the lowest tides, nor is it the half sum of the mean of all the high tides and the mean of all the low tides, which is called the half-tide level. *Mean sea level is the average height of the water, all stages of the tide being considered.* It is determined from observations made by means of tidal gages placed at stations where local conditions, such as long, narrow bays, rivers, and like features, will not affect the height of the water. To obtain even approximately correct results these observations must extend over at least one lunar month, and if accuracy is desired they must extend over several years. At ocean

stations the half-tide level and the mean sea level usually differ but little. It is assumed that there is no difference between the mean sea level as determined from observations in the Atlantic Ocean, the Gulf of Mexico, or the Pacific Ocean.

The connection with tidal stations for bench marks in certain areas that lie at some distance from the seacoast is still uncertain, and this fact is indicated by the addition of a letter or word to the right of the word "Datum" on tablets or posts. For such areas corrections for published results will be made from time to time as the precise-level lines of the United States Geological Survey or other Government organizations are extended.

Topographic maps.—Maps of the following quadrangles, wholly or partly in Pennsylvania, have been published by the United States Geological Survey up to July 1, 1912. They may be obtained, except as noted, for 5 cents each or \$3 a hundred on application to the Director of the Survey, at Washington, D. C.:

PRECISE LEVELING.

Damascus, Milford, and Susquehanna quadrangles.

PIKE AND SUSQUEHANNA COUNTIES.

The elevations in the following list are the result of a line of precise levels run from Binghamton to Poughkeepsie, N. Y. The two sections of this line, Binghamton to Hancock and Hancock to Poughkeepsie, form two links in the net of precise leveling in the United States, 49 and 138 miles in length, respectively.

The New York portion of this line is published in the bulletin of spirit leveling for the State of New York (Bull. 281, U. S. Geol. Survey). The leveling was done during June, July, and August, 1900, by C. H. Semper.

Gillett, Grover, Ralston, Trout Run, and Williamsport quadrangles.

BRADFORD AND LYCOMING COUNTIES.

The elevations in the following list are the Pennsylvania portion of the line of precise leveling run south from Elmira, N. Y., a point on the precise-level line of 1898, and connected at Williamsport, Pa., to a circuit of Pennsylvania Railroad levels from Harrisburg. The latter point is on the Coast and Geodetic Survey transcontinental precise line. This line, 75 miles in length, was involved as a factor in the 1903 adjustment of the precise-level net. The elevations have not been changed by the 1907 and 1912 adjustments.

The usual method of leveling and party outfit was used. The leveling was done in 1899 by C. H. Semper.

Williamsport, city hall, in front face near main entrance; aluminum tablet stamped "528 HARRISBURG 1899"	528.266

Kinzua, Warren, and Youngsville quadrangles.

WARREN COUNTY.

The elevations in the following list are the Pennsylvania portion of the result of two independent lines of precise leveling run in opposite directions between Salamanca, N. Y., and Irvineton, Pa. A large probable error occasioned the second running, with a result, however, checking to 0.043 foot the original figures. Both lines were run by the same methods as in previous work and with similar party outfits, each being a double-rodded, simultaneous, direct and reverse read line, employing special 10-foot double-faced targeted rods.

The leveling of 1899 was done by E. L. McNair, and that of 1902 by D. H. Baldwin.

KINZUA QUADRANGLE.

Corydon along Pennsylvania Railroad to Tuttletown.

Cambridge Springs, Erie, Foxburg, Franklin, Freeport, Kittanning, McKeesport, Meadville, Rural Valley, Sharpsburg, Stoneboro, and Union City quadrangles.

ALLEGHENY, ARMSTRONG, CLARION, CRAWFORD, ERIE, MERCER, AND VENANGO COUNTIES.

The elevations in the following list result from a line of precise levels extending from Erie to Pittsburgh, Pa. The initial bench mark is an aluminum tablet stamped "635 ERIE" in the water table of the northwest corner of the hospital wing of the Soldiers' Home, Erie, the elevation of which was previously determined by primary levels to be 58.588 feet above a bench mark of the army engineers, described as a chisel mark, at southwest corner of foundation of the lighthouse keeper's dwelling. The line extends south over the Pennsylvania Railroad to Leboeuf, thence over the Erie Railroad to Franklin, and from Franklin to Pittsburgh over the Allegheny Valley branch of the Pennsylvania Railroad. The leveling was done in 1899 by C. H. Semper, except the portion from Franklin to Emlenton, which was done by E. L. McNair.

Beaver, Butler, Newcastle, New Kensington, and Zelienople quadrangles.**BEAVER, BUTLER, AND LAWRENCE COUNTIES.**

The descriptions of bench marks in the Newcastle quadrangle are reprinted from Bulletin 288, page 49, with corrected elevations; the work in Butler, New Kensington, and Zelienople quadrangles is based upon bench marks at Bartley, Chicora, and Downieville, described in the same bulletin, pages 40 and 46. The previously published elevations for Bartley and Downieville were decreased 0.2 foot to agree with the 1907 adjustment of the Baltimore & Ohio Railroad precise level line.

The leveling in the Beaver and Newcastle quadrangles was done in 1901 by Ira M. Flocker, except that at Frisco. The leveling at Frisco and that in the Butler, New Kensington, and Zelienople quadrangles was done in 1907 by C. B. Burns.
