# RESULTS OF SPIRIT LEVELING IN VIRGINIA, 1900 TO 1913, INCLUSIVE.

## INTRODUCTION.

*Cooperation.*—The State of Virginia contributed financially, through the Virginia Geological Survey, Thomas L. Watson, State Geologist, to part of the work done since 1907.

*Previous publication.*—That portion of the results of spirit leveling in Virginia previously published in Bulletin 434, containing descriptions and elevations of bench marks established in Delaware, District of Columbia, Maryland, and Virginia from 1896 to 1909, inclusive, and based on the 1903 adjustment, has been corrected to agree with the 1907 adjustment of precise leveling of the Coast and Geodetic Survey, and is here republished, together with the results of spirit leveling by the United States Geological Survey in Virginia since 1909. The elevations by the 1907 adjustment were not changed by the 1912 adjustment and are not likely to be changed by any future adjustment of the level net.

*Personnel.*—The field work from 1900 to 1906, inclusive, was done under the direction of H. M. Wilson, geographer, and that from 1907 to 1911, inclusive, was done under Frank Sutton, geographer. The work since January, 1908, was done under the general direction of R. B. Marshall, chief geographer. Credit is given in the headings of the several lists to the respective levelmen. The office work of computation, adjustment, and preparation of lists was done mainly by S. S. Gannett, geographer, under the general direction of E. M. Douglas, geographer.

*Classification.*—The elevations are classified as precise or primary, according to the methods employed in their determination. The former are determined by lines of levels run either in both forward and backward directions or by simultaneous double-rodged lines, a high-grade instrument being used and special precautions being taken in

observations and reduction to correct errors and make the line continuously good throughout. The latter or primary levels are determined with the Y level, precautions being taken against only the principal errors and the levels being run mostly in circuits of single lines. The allowable limit of error observed on the precise work already done by the Geological Survey in this State is represented in feet by  $0.03\sqrt{D}$  and that for the primary work by  $0.05\sqrt{D}$ , in which  $D$  is the length of circuit in miles.

*Bench marks.*—The standard bench marks are of two forms. The first form is a circular bronze or aluminum tablet (*C* and *E*, Pl. I),  $3\frac{1}{2}$  inches in diameter and  $\frac{1}{4}$  inch thick, having a 3-inch stem, which is cemented in a drill hole in solid rock in the wall of some public building, a bridge abutment, or other substantial masonry structure. The second form (*F*, Pl. I), used where masonry or rock is not available, consists of a hollow wrought-iron post  $3\frac{1}{2}$  inches in outer diameter and 4 feet in length. It is split at the bottom and spread out to a width of 10 inches in order to give a firm bearing on the earth, and is set about 3 feet in the ground. A bronze or aluminum-bronze cap is riveted upon the top of the post. A third style of bench mark with abbreviated lettering (*B* and *D*, Pl. I), is used for unimportant points. This consists of a special copper nail  $1\frac{1}{2}$  inches in length driven through a copper washer  $\frac{7}{8}$  inch in diameter. The tablets as well as the caps on the iron posts are appropriately lettered, and cooperation by States is indicated by the addition of the State name (*G*, Pl. I).

The numbers stamped on the bench marks described in the following pages represent the elevations to the nearest foot as determined by the levelman. These numbers are stamped with  $\frac{3}{16}$ -inch steel dies on the tablets of post caps, to the left of the word "Feet." The office adjustment of the notes and the reduction to mean sea level datum may so change some of the figures that the original markings are 1 or 2 feet in error. It is assumed that engineers and others who have occasion to use the bench-mark elevations will apply to the Director of the United States Geological Survey, at Washington, D. C., for the adjusted values, and will use the markings as identification numbers only.

*Datum.*—All United States Geological Survey elevations are referred to mean sea level, which is the level that the sea would assume if the influence of winds and tides were eliminated. This level is not the elevation determined from the mean of the highest and the lowest tides, nor is it the half sum of the mean of all the high tides and the mean of all the low tides, which is called the half-tide level. Mean sea level is the average height of the water, all stages of the tide being considered. It is determined from observations made by

means of tidal gages placed at stations where local conditions, such as long, narrow bays, rivers, and like features, will not affect the height of the water. To obtain even approximately correct results these observations must extend over at least one lunar month, and if accuracy is desired they must extend over several years. At ocean stations the half-tide level and the mean sea level usually differ but little. It is assumed that there is no difference between the mean sea levels determined from observations in the Atlantic Ocean, the Gulf of Mexico, and the Pacific Ocean.

The connection with tidal stations for bench marks in certain areas that lie at some distance from the seacoast is still uncertain, and this fact is indicated by the addition of a letter or word to the right of the word "Datum" on tablets or posts. For such areas corrections for published results will be made from time to time as the precise-level lines of the United States Geological Survey or other Government organizations are extended.

*Topographic maps.*—Maps of the following quadrangles wholly or partly in Virginia have been published by the United States Geological Survey up to September 1, 1914. They may be obtained for 10 cents each or \$3 for 50, except as otherwise noted, on application to the Director of the Survey at Washington, D. C.

### PRECISE LEVELING.

Bonsacks, Cahas Mountain, Callaghan, Clarksville, Clifton Forge, Eagle Rock,  
 Martinsville, Natural Bridge, and Rocky Mount quadrangles.

ALLEGHANY, BOTETOURT, FRANKLIN, HENRY, MECKLENBURG, AND ROANOKE  
 COUNTIES.

The following list embodies the Virginia portion of the results of two lines of precise levels. The first line, a spur from Durham, N. C., to Clarksville, Va., was run in 1905 by R. L. Libbey. The second line, from Greensboro, N. C., to Lock No. 6, near Charleston, W. Va., was run in three sections: (1) From Greensboro, N. C., to Buchanan, Va., along the Norfolk & Western Ry., in 1905, by R. L. Libbey; (2) from Buchanan to Moss Run, along the Chesapeake & Ohio Ry., in 1906, by N. A. Campbell; and (3) from Moss Run to Lock No. 6, along the Chesapeake & Ohio and the Kanawha & Michigan railways, in 1907, by C. H. Semper.

The closure error of the second line upon the United States Army Engineer Corps elevation at Lock No. 6, corrected to accord with the 1903 adjustment, was 0.732 foot high; but this error has been removed by adjustment over a total distance of 365 miles.

**Bramwell and Peterstown quadrangles.****GILES AND TAZEWELL COUNTIES.**

The following is the Virginia portion of the unadjusted results of a line of precise levels run from Hinton, W. Va., south along highway to Glenlyn, Va., thence west along Norfolk & Western Ry. to Graham, Va., based upon an elevation at Hinton, determined by precise leveling adjusted to agree with the 1912 adjustment. The leveling was done by two parties joining at a point 2 miles west of Oakvale. Yard rods and prism levels were used and the latest method was followed. The total length of double line is 57.8 miles and the total divergence was plus 0.155 foot. For elevations in the West Virginia portion of these quadrangles see Bulletin 477.

The leveling was done in 1909 in Peterstown quadrangle by C. H. Semper and in Bramwell quadrangle by T. A. Green.

Fairfax, Haymarket, Indian Head, Seneca, and Washington quadrangles.

FAIRFAX, LOUDOUN, AND PRINCE WILLIAM COUNTIES.

The elevations in the following list were determined by primary leveling and accord with Bulletin 434, being unchanged by the 1912 adjustment.

The leveling was done in 1911 in Fairfax, Haymarket, Seneca, and Washington quadrangles by E. E. Witherspoon, and in Indian Head quadrangle by J. B. Metcalfe. Additional leveling was done in the Washington quadrangle in 1912 by F. J. McMaugh and D. H. Baldwin. All of these levelmen used wye levels except Baldwin, who used a prism level. Part of the leveling in Seneca quadrangle was done in 1906 by R. A. Farmer.

Boynton, Brookneal, Cahas Mountain, Callands, Chatham, Clarksville, Clover, Lynchburg, Moneta, Nathalie, and Virgilina quadrangles.

**CAMPBELL, CHARLOTTE, HALIFAX, MECKLENBURG, AND PITTSYLVANIA COUNTIES.**

The elevations in the following list result mainly from a line of levels run in 1905 by A. H. Horton, of the Water-Resources branch of the Survey from a bench mark at Clarksville established by the precise-level party of R. L. Libbey. The line follows Roanoke River (approximately) from Clarksville to Hurt; thence the railroad via Elba to Rocky Mount, where it is connected with a bench mark also established by Libbey. A spur line extends 14 miles down Roanoke River from Clarksville, and another line extends from Toshes to Deerwood Ford.

Additional work was done in 1908 by E. O. Halbert, in cooperation with the State, in Clarksville, Clover, Nathalie, and Virgilina quadrangles, based on bench marks at Clarksville, Randolph, and Clarkton.

**Big Stone Gap, Bramwell, Bucu, Burkes Garden, Clintwood, Coeburn, Glade Springs, Hagan, Hansonville, Middlesboro, Nolansburg, Pound, Pounding Mill, Regina, Richlands, Sneedville, and Wise quadrangles.**

**DICKENSON, LEE, RUSSELL, TAZEWEILL, AND WISE COUNTIES.**

The following elevations were determined by primary leveling, using prism level and yard rod. The line was double run from Graham to Cumberland Gap. The circuit from Norton via Pound, Clintwood, and Dante, to a point near St. Paul was single. The elevations, which were based on the 1903 adjustment, are unchanged by the 1907 or 1912 adjustments and accord with those in bulletins 434 and 441.

The leveling was done by L. F. Biggs in 1912. Additional leveling with Y level and New York rod was done in 1912 in Clintwood quadrangle by C. W. Arnold, in Wise quadrangle by J. B. Metcalfe, in Pound quadrangle by Arnold, Metcalfe, and H. S. Senseney, and in 1913 by Senseney and S. R. Archer; in Bucu, Clintwood, Coeburn, and Regina quadrangles in 1913 by Senseney.

The work was done in cooperation with the State.
