GEOLOGICAL SURVEY BENCH MARKS.

A, Tablet used in cooperating States. The State name is inserted at G.  
 B and D, Copper temporary bench mark, consisting of a nail and copper washer.  
 A, C, and E, Tablets for stone or concrete structures.  
 F, Iron post used where there is no rock.

# RESULTS OF SPIRIT LEVELING IN COLORADO, 1896 TO 1914, INCLUSIVE.

R. B. MARSHALL, Chief Geographer.

## INTRODUCTION.

*Previous publication.*—The results of spirit leveling previously published in Bulletin 486, containing descriptions and elevations of bench marks established in Colorado from 1896 to 1910, inclusive, and based on the preliminary 1911 adjustment, have been corrected to agree with the 1912 adjustment of precise leveling of the Coast and Geodetic Survey and are here republished, together with all results of spirit leveling by the United States Geological Survey since 1910. The elevations are likely to be changed but slightly by any future adjustment.

*Personnel.*—The field work from 1896 to 1906, inclusive, was done under the general direction of E. M. Douglas, geographer; that for 1907 to 1909, inclusive, under E. C. Barnard, geographer; and the later work under Sledge Tatum, geographer, under the general direction of R. B. Marshall, chief geographer. The names of the respective levelmen are given in the introductions to the several lists. The office work of computation, adjustment, and preparation of lists was done mainly by S. S. Gannett, geographer, under the general direction of E. M. Douglas, geographer.

*Classification.*—The elevations are classified as precise or primary, according to the methods employed in their determination. For precise-level lines instruments and rods of the highest grade are used, each line is run in both forward and backward directions, and every precaution is taken to guard against error. The allowable divergence between the forward and the backward lines in feet is represented by the formula  $0.017\sqrt{D}$ , in which  $D$  is the distance in miles between bench marks. For primary lines standard Y levels are used; lines are run in circuits or are closed on precise lines, with an allowable losing error in feet represented by  $0.05\sqrt{D}$ , in which  $D$  is the length of the circuit in miles, sufficient care being given to the work to maintain this standard. For levels of both classes careful office adjustments are made, the small outstanding errors being distributed over

the lines. Orthometric corrections have been applied in determining the following elevations.

*Bench marks.*—The standard bench marks are of two forms. The first form is a circular bronze or aluminum tablet (*C* and *E*, Pl. I),  $3\frac{1}{2}$  inches in diameter and one-fourth inch thick, having a 3-inch stem, which is cemented in a drill hole in solid rock in the wall of some public building, a bridge abutment, or other substantial masonry structure. The second form (*F*, Pl. I), used where masonry or rock is not available, consists of a hollow wrought-iron post  $3\frac{1}{2}$  inches in outer diameter and 4 feet in length. It is split at the bottom and expanded to a width of 10 inches in order to give a firm bearing on the earth, and is set about 3 feet in the ground. A bronze or aluminum-bronze cap is riveted upon the top of the post. A third style of bench mark with abbreviated lettering (*B* and *D*, Pl. I) is used for unimportant points. This consists of a special copper nail,  $1\frac{1}{2}$  inches in length, driven through a copper washer seven-eighths of an inch in diameter.

The tablets, as well as the caps on the iron posts, are appropriately lettered, and State cooperation is indicated by the addition of the State name (*G*, Pl. I).

The numbers stamped on the bench marks described in the following pages represent the elevations to the nearest foot, as determined by the levelman. These numbers are stamped with  $\frac{3}{16}$ -inch steel dies on the tablets or post caps, to the left of the word "feet." The office adjustment of the notes and the reduction to mean sea level datum may so change some of the figures that the original markings are 1 or 2 feet in error. It is assumed that engineers and others who have occasion to use the bench-mark elevations will apply to the Director of the United States Geological Survey at Washington, D. C., for the adjusted values, and will use the markings as identification numbers only.

*Datum.*—All United States Geological Survey elevations are referred to mean sea level, which is the level that the sea would assume if the influence of tides and winds were eliminated. This level is not the elevation determined from the mean of the highest and the lowest tides, nor is it the half sum of the mean of all the high tides and the mean of all the low tides, which is called the half-tide level. *Mean sea level is the average height of the water, all stages of the tide being considered.* It is determined from observations made by means of tidal gages placed at stations where local conditions, such as long narrow bays, rivers, and like features will not affect the height of the water. To obtain even approximately correct results these observations must extend over at least one lunar month, and if accuracy

is desired they must extend over several years. At ocean stations the half-tide level and the mean sea level usually differ but little. It is assumed that there is no difference between the mean sea levels determined from observations in the Atlantic Ocean, the Gulf of Mexico, or the Pacific Ocean.

The connection with tidal stations for bench marks in certain areas that lie at some distance from the seacoast is still uncertain, and this fact is indicated by the addition of a letter or word to the right of the word "Datum" on tablets or posts. For such areas corrections of published results will be made from time to time as the precise-level lines of the United States Geological Survey or other Government organizations are extended.

*Topographic maps.*—Maps of the following quadrangles, wholly or partly in Colorado, have been published by the United States Geological Survey up to April 6, 1915. They may be obtained (except as noted) for 10 cents each, or \$3 for fifty, on application to the Director of the Geological Survey, Washington, D. C.:

### PRECISE LEVELING.

Cameo, Como, Delta, Denver, Eagle, Glenwood Springs, Grand Junction, Hotchkiss, Leadville, Montrose, Mount Powell, Platte Canyon, and Rifle quadrangles.

ARAPAHOE, DELTA, DOUGLAS, EAGLE, GARFIELD, JEFFERSON, LAKE, MESA, MONTROSE, OURAY, PARK, AND SUMMIT COUNTIES.

The elevations in this list are based on a bench mark of the Coast and Geodetic Survey near Denver, Colo., described as follows: "Petersburg, 1 mile north of, bottom of a chiseled square on second step of northeast abutment of the Denver & Rio Grande Railroad bridge." Its elevation is accepted as 5,281.269 feet.

The leveling was done in 1908 by C. H. Semper.

## PRIMARY LEVELING.

Denver, Greeley, Loveland, and Niwot quadrangles.

ARAPAHOE, BOULDER, AND WELD COUNTIES.

The elevations in the following list are based on the elevation of the top of the lower pedestal at the southeast corner of the steps of the Colorado State capitol, at Denver. The point is marked by the letters "U. S. B. M." cut in the top of a granite block. The elevation as obtained from the Coast and Geodetic Survey transcontinental line of leveling is accepted as 5,278.527 feet.

Leveling was done in all four quadrangles in 1897 by Thomas Winsor and in 1899 by E. W. Glafcke and A. E. Franklin. Additional work was done in the Loveland and Niwot quadrangles in 1902 by F. M. Taylor.

**Fort Collins, Livermore, Longs Peak, and Mount Olympus quadrangles.**

**LARIMER COUNTY.**

The elevations in the following list are based on the elevation of the lower pedestal at the southeast corner of the steps of the Colorado State capitol, at Denver, described on page 21.

The leveling was done in 1905 by G. A. Joslin and additional leveling in Longs Peak quadrangle was done in 1912-13 by C. A. Ecklund and in 1914 by Roscoe Reeves, and in Livermore quadrangle in 1914 by Ecklund and Reeves.

The line from Bellvue to Livermore was run as a precise line. The circuit from Forks Hotel through Alvord and return to Forks Hotel was a single line using the same level. The other lines were run with a Y level and New York rods.

## Home quadrangle.

## GRAND AND LARIMER COUNTIES.

The elevations in the following list were determined by primary leveling and accord with the 1912 adjustment. Orthometric and rod corrections have been applied.

The leveling was done in 1914 by C. A. Ecklund and Roscoe Reeves.

NOTE.—The line north from Gleneyre into Laramie quadrangle, Wyoming, closes 2.2 feet high upon an adjusted elevation, page 22, Bulletin 558.

## Julesburg quadrangle.

## SEDGWICK COUNTY.

The three following elevations are approximate only; they depend on the bench mark established in 1896 at Sidney, Nebr., consisting of a copper bolt set in the astronomic monument in the parade grounds of old Fort Sidney, marked "U.S.G.S 4086 feet B.M." The elevation of this bench mark has been accepted as 4,086.279 feet above mean sea level, based on Union Pacific Railroad datum.

The leveling was done by R. C. Cornish in 1897.

**Apishapa, Nepesta, and Pueblo quadrangles.**

**LAS ANIMAS, OTERO, AND PUEBLO COUNTIES.**

The elevations in the following list are determined by primary leveling extended from Colorado Springs. The lines southeast from Pueblo were originally based upon an elevation at Pueblo determined from leveling of the Denver & Rio Grande Railroad, corrected to

accord with the 1906 accepted height of a bench mark at Colorado Springs. The values here given, however, result from a double connection by the U. S. Geological Survey in 1911, and accord with the 1912 adjustment of the Coast and Geodetic Survey. Orthometric corrections have been applied, increasing the observed values cumulatively toward the south.

The leveling was done in 1896 by J. C. Barber, except that on the line from Pinyon to Pueblo, which was done in 1905 by C. I. Anderson, and the connection at Pueblo in 1911 by C. P. Gross.

<b>Craig, Elkhead, Hahns Peak, Meeker, North Park, Pagoda, Rabbit Ears, and Rifle quadrangles.</b>	

**GARFIELD, MOFFAT, RIO BLANCO, AND ROUTT COUNTIES.**

The elevations in the following list were determined by primary leveling extended from a precise-level bench mark at Rifle. Orthometric corrections have been applied and adjustment made to accord with corrected primary-level elevations in Wyoming.

The leveling was done in 1910 by C. H. Semper, except that in the northern portion of the Elkhead quadrangle, which was done by Donnell Miller in 1901 and by P. W. McMillan in 1910, and that in the North Park quadrangle, which was done by Donnell Miller in 1901 and by C. W. Rowell in 1911. Additional leveling in Hahns

Peak and Meeker quadrangles was done by Rowell in 1911, and in Meeker quadrangle by R. M. Copeland in 1911 and by G. W. Lucas in 1912; in Elkhead and Craig quadrangles by Rowell in 1913 and by C. T. Moore in 1914.

<b>Lake City and Ouray 15' quadrangles; Montrose and Uncompahgre Peak 30' quadrangles.</b>	

## GUNNISON, HINSDALE, MONTROSE, AND OURAY COUNTIES.

The elevations in the following list were determined by primary leveling extended from Ridgway and Montrose on the precise-level line run from a station near Denver in 1908.

The leveling was done in the Ouray 15' (Montrose 30') quadrangle in 1901 by Chester Irvine, in the Lake City 15' (Uncompahgre Peak 30') quadrangle in 1903 by J. E. Chapson; in the Montrose and Uncompahgre Peak 30' quadrangles in 1908 by R. P. Thompson; and in the Montrose quadrangle in 1909 by J. A. Burris and F. J. McMaugh.

The bench marks set in 1908 were not stamped with the figures of elevation.

**Coventry, Montrose, and Naturita quadrangles.****MONTROSE, OURAY, AND SAN MIGUEL COUNTIES.**

The elevations in the following list were determined by primary leveling and accord with the 1912 adjustment. Orthometric and rod corrections have been applied. Some uncertainty in the value of these data is caused by unreliability of the accepted value of the

elevation of a bench mark east of Sams, which is probably  $\pm 0.6$  foot in error, and by an excessive closure error in the circuit run from this point via Nucla to a point near Montrose. In fixing a value for Nucla, however, double weight was given to the value derived from Montrose.

The leveling was done in 1914 by C. W. Rowell.

<b>Creede, Del Norte, Engineer Mountain, Needle Mountains, Rico, and Silverton 15' quadrangles, and San Cristobal 30' quadrangle.</b>	

**DOLORES, HINSDALE, LA PLATA, MINERAL, OURAY, AND SAN JUAN COUNTIES.**

The elevations in the following list are based upon heights of bench marks at Montrose, Colo., established by precise leveling of the United States Geological Survey, and at Albuquerque, N. Mex., established by precise leveling of the Coast and Geodetic Survey, the connection being made by a primary-level net.

The leveling in the Creede quadrangle was done in 1904 by J. E. Chapson; in 1913 by H. B. Edwards and C. C. Holder; that in the San Cristobal quadrangle in 1899 by T. Winsor, in 1904 by Chapson, and in 1913 by Holder; that in the Silverton quadrangle in 1899 by Winsor and in 1901 by Chester Irvine; that in the Needle Mountains quadrangle in 1898 by T. Winsor and in 1900 by J. P. Darling; that in the Engineer Mountain quadrangle in 1896 by C. W. Beach, in 1897 by A. L. Fellows, and in 1898 by Winsor; and that in the Rico quadrangle in 1898 by Winsor.

The considerable error in stamped elevations is due to the assumed datums upon which the field work was done.

**Del Norte, Hooper, La Jara, Saguache, and Silesia Peak quadrangles.****COSTILLA, CONEJOS, RIO GRANDE, AND SAGUACHE COUNTIES.**

The elevations in the following list were determined by primary leveling and accord with the 1912 adjustment of precise leveling. They are dependent on an elevation at Del Norte determined by a double-rodged line from Creede. Orthometric corrections have been applied. These corrections are in addition to those necessary to close circuits, and they lower elevations at the northern limits of this work 0.5 foot with respect to those at its most southern point.

The leveling was done in Del Norte quadrangle, in 1914, by J. R. Ellis and R. W. Burchard; in Hooper and La Jara quadrangles, in 1914, by Ellis, Burchard, and R. R. Monbeck; and in Saguache and Silesia Peak quadrangles, in 1914, by Burchard.

The leveling in the Ignacio quadrangle was done in 1896 by C. W. Beach, in 1899 by T. Winsor, in 1900 by J. P. Darling, in 1906 by A. R. Carver, and in 1907 by F. A. Nussle; that in the Pagosa Springs quadrangle in 1899 by Winsor, in 1906 by Carver, and in 1907 by Nussle; and that in the Summitville quadrangle in 1906 by Carver, in 1912 by C. P. McKinley, and in 1913 by C. C. Holder.

The considerable difference between stamped and adjusted elevations is due mostly to errors in the assumed data upon which the field work was based and partly to errors in field computation.

## LA PLATA AND MONTEZUMA COUNTIES.

The elevations in the following list are based on heights of bench marks in southwest Colorado.

<sup>1</sup> An excessive error was distributed in this line.

The leveling was done in 1910 by M. R. McDanal and by R. M. Copeland in 1911.

Additional leveling was done in Soda Canyon quadrangle in 1912 by C. P. McKinley.

The leveling in Red Mesa quadrangle was done in 1911 by R. M. Copeland.
