SPIRIT LEVELING IN LOUISIANA, 1903 TO 1915, INCLUSIVE.

R. B. MARSHALL, Chief Geographer.

INTRODUCTION.

Cooperation.—The State of Louisiana contributed financially to the work of 1906 through the State Geological Survey, Prof. G. D. Harris, State geologist, and in 1909 through the Fifth Louisiana levee district, J. T. McClellan, president of the board of commissioners.

Previous publication.—That part of the results of spirit leveling in Louisiana previously published in Bulletin 458 based on the 1907 adjustment has been corrected to agree with the 1912 adjustment of precise leveling of the Coast and Geodetic Survey and is here republished, together with results of spirit leveling by the United States Geological Survey in Louisiana since 1909. The elevations by the 1907 adjustment were changed but slightly by the 1912 adjustment and are not likely to be changed by any future adjustment of the level net.

Personnel.—The field work from 1903 to 1906, inclusive, was done under the direction of H. M. Wilson, geographer, and that from 1907 to 1915, inclusive, was done under Frank Sutton, geographer. The work since January, 1908, was done under the general direction of R. B. Marshall, chief geographer. Credit is given to the respective levelmen in the headings of the several lists. The office work of computation, adjustment, and preparation of lists was done mainly by S. S. Gannett, geographer, under the general direction of E. M. Douglas, geographer.

Classification.—The elevations are classified as precise or primary, according to the methods employed in their determination. The former are determined by lines of levels run either in both forward and backward directions or by simultaneous double-rodged lines, a high-grade instrument being used and special precautions being taken in observations and reduction to correct errors and make the line continuously good throughout. The latter or primary levels are determined with the Y level, precautions being taken against only the principal errors and the levels being run mostly in circuits of single lines. The allowable limit of error observed on the precise work already

done by the Geological Survey in this State is represented in feet by $0.017\sqrt{D}$ and that for the primary work by $0.05\sqrt{D}$, in which D is the length of the circuit in miles.

Bench marks.—The standard bench marks are of two forms. The first form is a circular bronze or aluminum tablet (*C* and *E*, Pl. I), $3\frac{1}{2}$ inches in diameter and $\frac{1}{4}$ inch thick, having a 3-inch stem, which is cemented in a drill hole in solid rock in the wall of some public building, a bridge abutment, or other substantial masonry structure. The second form (*F*, Pl. I), used where masonry or rock is not available, consists of a hollow wrought-iron post $3\frac{1}{2}$ inches in outer diameter and 4 feet in length, which is set about 3 feet in the ground. The bottom is spread out to a width of 10 inches in order to give a firm bearing in the earth, and a bronze or aluminum-bronze cap is riveted upon the top of the post. A third style of bench mark, with abbreviated lettering (*B* and *D*, Pl. I), is used for unimportant points. This consists of a special copper nail $1\frac{1}{2}$ inches in length driven through a copper washer $\frac{3}{8}$ inch in diameter. The tablets as well as the caps on the iron posts are appropriately lettered, and cooperation by a State is indicated by the addition of the State name (*G*, Pl. I).

The numbers stamped on the bench marks described in the following pages represent the elevations to the nearest foot as determined by the levelman. These numbers are stamped with $\frac{3}{16}$ -inch steel dies on the tablets or post caps, to the left of the word "Feet." The office adjustment of the notes and the reduction to mean sea level datum may so change some of the figures that the original markings are 1 or 2 feet in error. It is assumed that engineers and others who have occasion to use the bench-mark elevations will apply to the Director of the United States Geological Survey, at Washington, D. C., for the adjusted values, and will use the markings as identification numbers only.

Datum.—All elevations determined by the United States Geological Survey and United States Coast and Geodetic Survey are referred to mean sea level, which is the level that the sea would assume if the influence of winds and tides were eliminated. This level is not the elevation determined from the mean of the highest and the lowest tides, nor is it the half sum of the mean of all the high tides and the mean of all the low tides, which is called the half-tide level. *Mean sea level is the average height of the water, all stages of the tide being considered.* It is determined from observations made by means of tidal gages placed at stations where local conditions, such as long, narrow bays, rivers, and like features, will not affect the height of the water. To obtain even approximately correct results these observations must extend over at least one lunar month, and if accuracy is desired they must extend over several years. At ocean stations the

half-tide level and the mean sea level usually differ but little. It is assumed that there is no difference between the mean sea levels determined from observations in the Atlantic Ocean, the Gulf of Mexico, and the Pacific Ocean.

The connection with tidal stations for bench marks in certain areas that lie at some distance from the seacoast is still uncertain, and this fact is indicated by the addition of a letter or word to the right of the word "Datum" on tablets or posts. For these areas corrections for published results will be made from time to time as the precise-level lines of the United States Geological Survey or other Government organizations are extended.

Topographic maps.—Maps of the following quadrangles, wholly or partly in Louisiana, have been published by the United States Geological Survey up to July 1, 1916. They may be obtained at 10 cents each or \$3 for 50 on application to the Director of the Survey, at Washington, D. C.

PRECISE LEVELING.

Crowley, Derouen, Duson, Jeanerette, Arthur Lake, and St. Martinville quadrangles.

ACADIA, CALCASIEU, IBERIA, LAFAYETTE, AND ST. MARY PARISHES.

The following are the unadjusted results of a spur line of precise levels from Weeks Island east along the Cypremort branch of the Southern Pacific Railroad to Baldwin, thence along the main line of the Southern Pacific Railroad northwest to Lafayette, thence west to Jennings, a total distance of about 100 miles. The work was done in cooperation with the Louisiana Geological Survey, Prof. G. D.

Harris, State geologist, in charge. Prof. Harris established an automatic tide gage and several bench marks, descriptions of which are included, on Weeks Island in February, 1905. The line starts from bench mark No. 1 (upper), one of those established by Prof. Harris. This bench mark is the rounded top of a brass plug protruding through the cap on an iron post set about 250 yards west of the terminus of the railroad at the Weeks Island salt mine, and about 0.8 mile east from the tide gage. The elevation as determined by the Coast and Geodetic Survey in 1905 and 1906 is 19.42 feet above mean sea level.

The leveling was done in 1906 by E. L. McNair.

Bench mark No. 4, inside Myles Salt Co. inclosure, about 30 feet east of gate to main road, in sleeve coupling screwed to top of 2.5-inch iron pipe 4 feet long, which has an 8-inch flange screwed to bottom; top of 1.5-inch square bolt.....	127. 898
Bench mark No. 5, southwest side of deep cut in road from Foote sugarhouse to Sandy Bottom Lake, about 15 feet west of edge of cut on high ground, well hidden in underbrush; United States Geological Survey standard iron post.....	81. 414
Bench mark No. 6, northeastern point of ridge, about 0.1 mile west of outlet stream of Sandy Bottom Lake; United States Geological Survey standard iron post.....	72. 910

¹ Bench marks numbered 1 to 6 were established by Prof. G. D. Harris, State geologist (Louisiana Geological Survey).

² This tide station was established by Prof. G. D. Harris at the expense of the Louisiana Geological Survey, but the gage was set and records made by and at the expense of the Coast and Geodetic Survey. The elevation given was determined from the automatic record for the years 1905 and 1906. The tide at Weeks, La., is diurnal, or has one high water and one low water in each day, about half the time.

The elevations in the following list were determined by a spur line of precise levels extended from bench mark No. 69 of the United States Army Corps of Engineers at Colfax, La. This bench mark is a copper bolt in a buried stone surmounted by an iron pipe, the elevation of the cap of which is accepted as 100.351 feet above mean tide. A prism level and yard rods were used.

The leveling was done in October, 1906, by E. L. McNair.

Harrisonburg, Lake Providence, St. Joseph, Tallulah, and Vicksburg 30' quadrangles and several 7½' subdivisions (Tensas drainage district).

EAST CARROLL, WEST CARROLL, CONCORDIA, MADISON, AND TENSAS PARISHES.

The elevations in the following list were determined by primary leveling extended from the various bench marks of the Coast and Geodetic Survey and the Mississippi River Commission precise-level lines.

The leveling was done in 1909, in the Lake Providence quadrangle by H. W. Peabody and T. A. Green; in the Tallulah and Vicksburg quadrangles by W. H. Gray and Green; in the Harrisonburg quadrangle by Green; and in the St. Joseph quadrangle by Gray, Green, and Peabody.

This list is not arranged according to 7½' quadrangles. Gray's leveling was in the area of the 7½' sheets named Millikens Bend, Mound, and Delta Point; Peabody's in Wilsons Point, Millikin, Baxter Bayou, Lake Providence, Longwood, Atherton, Waddill, and Delta Bridge; and Green's in Millikin, Ashton Bridge, Baxter Bayou, Atherton, Stamboul, Tallulah, IX, Mound, Delta Point, Kelloggs Landing, Ashwood, XVI, Newellton, Lake Bruen, Delta-bridge, Dickard, Gumridge, Ferriday, Sycamore, and Natchez.
