CONTRIBUTIONS TO ECONOMIC GEOLOGY

(SHORT PAPERS AND PRELIMINARY REPORTS)

1919

PART I.—METALS AND NONMETALS EXCEPT FUELS

F. L. RANSOME AND E. F. BURCHARD
GEOLOGISTS IN CHARGE

WASHINGTON
GOVERNMENT PRINTING OFFICE
1920

CONTENTS.

[The letters in parentheses preceding the titles are those used to designate the papers for advance publication.]

	Page.
Introduction.....	vii
(A) A reconnaissance of the Pine Creek district, Idaho, by E. L. Jones, jr. (published Aug. 27, 1919).....	1
(B) Deposits of manganese ore in New Mexico, by E. L. Jones, jr. (published Oct. 21, 1919).....	37
(C) Deposits of manganese ore in Costa Rica, by J. D. Sears (published Dec. 30, 1919).....	61
(C) Deposits of manganese ore near Boqueron River, Panama, by J. D. Sears (published Dec. 30, 1919).....	85
(D) Deposits of manganese ore in Arizona, by E. L. Jones, jr., and F. L. Ransome (published Jan. 29, 1920).....	93
(E) Deposits of manganese ore in southeastern California, by E. L. Jones, jr. (published Dec. 30, 1919).....	185
(F) Deposits of manganese ore in Nevada, by J. T. Pardee and E. L. Jones, jr. (published February 20, 1920).....	209
Index	243

CONTRIBUTIONS TO ECONOMIC GEOLOGY, 1919.

PART I. METALS AND NONMETALS EXCEPT FUELS.

F. L. RANSOME and E. F. BURCHARD, *Geologists in charge.*

INTRODUCTION.

The Survey's "Contributions to economic geology" have been published annually since 1902. In 1906 the increase in the number of papers coming under this classification made it necessary to divide the contributions into two parts, one including papers on metals and nonmetals except fuels and the other including papers on mineral fuels. In 1915 the year included in the title was changed from the year in which the field work reported in these papers was done to the year of publication, and in consequence there was no volume entitled "Contributions to economic geology, 1914." The subjoined table gives a summary of these bulletins.

United States Geological Survey "Contributions to economic geology."

^a The date given is that of the complete volume; beginning with Bulletin 285, the papers have been issued as advance chapters as soon as they were ready.

As the subtitle indicates, most of the papers in these volumes are of three classes—(1) short papers describing as thoroughly as conditions will permit areas or deposits on which no other report is likely to be prepared; (2) brief notes on mining districts or economic deposits whose examination has been merely incidental to other work;

and (3) preliminary reports on economic investigations the results of which are to be published later in more detailed form.

Although these papers set forth mainly the practical results of economic investigations they include brief theoretical discussions and summary statements of conclusions if these appear to require prompt publication.

Beginning in the spring of 1917 and continuing throughout the period of the war the United States Geological Survey made special field explorations, surveys, and laboratory studies of deposits of ores of metals used in the manufacture of ferroalloys, pig iron, and steel, including manganese, chromium, tungsten, molybdenum, titanium, uranium, vanadium, zirconium, and iron. During the seasons of 1917 and 1918 21 geologists and several temporary assistants were engaged in this work. More than 2,500 deposits were examined in 27 States, Cuba, Porto Rico, Santo Domingo, Costa Rica, and Panama. As soon as the field examination of a group of deposits could be completed systematic notes giving estimates of tonnage of ores were sent to Washington for the information of the Shipping, War Industries, and War Trade boards and other Government organizations that were interested in the question of what domestic supplies were available for substitution for foreign ores.

Summaries of the data were promptly published by the Geological Survey in the form of press bulletins, and several longer papers on these subjects have been published by the American Institute of Mining and Metallurgical Engineers.¹ Other papers prepared largely by Federal Survey geologists have been published by several State surveys.² The papers on manganese ore in this bulletin are some of the results of this war work, and other papers, now in preparation, will be published in "Contributions to economic geology, 1920." In the field work the United States Geological Survey enjoyed the cooperation of the California State Council of Defense and the State geological surveys of Colorado, Georgia, Minnesota, Tennessee, and Virginia, the University of Nevada, the New Mexico State School of Mines, and the United States Bureau of Mines.

During the war period there were large increases in the domestic production of manganese, chrome, tungsten, and other ores of this

steel-hardening group and of the ferroalloys. To war prices is doubtless due part of the stimulation for this increased production, but it is believed that the work of the Federal geologists and their associates did much to encourage miners to patriotic efforts to develop domestic deposits of war-important minerals.
