
NOMOGRAM OF TEMPERATURES FOR SAMPLING SITES

[NOTE: Mean annual range of temperature (horizontal axis is derived from the difference between the mean temperatures of the warm month and the cold month. Temperature divisions shown are based on the major physiognomic subdivisions of the humid to mesic forests of eastern Asia (J.A. Wolfe, 1979, U.S. Geological Survey Professional Paper 1106). Also plotted are some samples that, because they contain less than 20 species, are not included in the CLAMP database; these samples, however, are included in some discussions.]

A METHOD OF OBTAINING CLIMATIC PARAMETERS FROM LEAF ASSEMBLAGES
