GEOLOGICAL SURVEY CIRCULAR 578

Washington 1968
Index of Surface-Water Records to September 30, 1967

Part 8—Western Gulf of Mexico Basins

By H. P. Eisenuth

INTRODUCTION

This report lists the streamflow and reservoir stations in the Western Gulf of Mexico basins for which records have been or are to be published in reports of the Geological Survey for periods through September 30, 1967. It supersedes Geological Survey Circular 508.

Basic data on surface-water supply have been published in an annual series of water-supply papers consisting of several volumes, including one each for the States of Alaska and Hawaii. The area of the other 48 States is divided into 14 parts whose boundaries coincide with certain natural drainage lines. Prior to 1951, the records for the 48 States were published in 14 volumes, one for each of the parts. From 1951 to 1960, the records for the 48 States were published annually in 18 volumes, there being 2 volumes each for Parts 1, 2, 3, and 6. The boundaries of the various parts are shown on the map in figure 1.

Beginning in 1961, the annual series of water-supply papers on surface-water supply was changed to a 5-year series. Records for the period 1961-65 will be published in a series of water-supply papers using the same 14 part division for the 48 States, but most parts will be further subdivided into two or more volumes. In order to meet interim requirements, beginning in 1961, local offices issue reports annually containing streamflow records for the State or States within the local district.

In addition to the continuous-record gaging stations, this index includes crest-stage and low-flow partial-record stations. A continuous-record station is a gaging station on a stream or reservoir for which the discharge, stage, or contents is published on a daily, weekly, or monthly basis for a continuous period of time. A crest-stage partial-record station is a streamflow station for which only the annual maximum discharge is published over a period of years for use in floodflow analyses. A low-flow partial-record station is a streamflow station for which only discharge measurements made at base flow, when streamflow is primarily from ground-water storage, are published. Measurements are generally collected over a period of five years or more for use in low-flow analyses. Discharge measurements have been made at many sites and published as miscellaneous measurements. Such measurements are not included in this index except those made in earlier years at sites now classified as low-flow partial-record stations.

Explanation of reference marks is given at the end of the index.

An alphabetical list of streams, lakes, and reservoirs is given at the end of this circular.

DOWNSTREAM ORDER

The stations in this index are listed in the downstream order used in the series of water-supply papers on surface-water supply of the United States since 1951. Starting at the headwater of each stream, all stations are listed in a downstream direction. Tributary streams are indicated by indentation and are inserted between main-stem stations in the order in which they enter the main stream. To indicate the rank of any tributary on which a record is available and the stream to which it is immediately tributary, each indentation in the listing of stations represents one rank. A stream name, only, is inserted where necessary for the purpose of showing the proper rank or order of tributaries.

STATION NAMES

Station names are given in their most recently published form. Parentheses around part of a station name indicate that the enclosed word or words were used in an earlier published name of the station or as an alternate name. Parenthetical explanations are also used to indicate that a stream of a different name is the head of the main stream by use of "(head of ________ River)" and that the name of the main stream has changed by use of "(continuation of ________ River)."
STATION NUMBER

As an added means of identification, each continuous- and partial-record station has been assigned a station number. The numbers have been assigned in the same downstream order used in this index. In assigning station number, gaps were left to allow for new stations that may be established; hence the numbers are not consecutive. The complete number for each station includes the part number, which is omitted in this index. The number given consists of only the essential digits of the complete number. For example, for a station with the complete number 08-0117.00, the station number shown in this index is 0117.

DRAINAGE AREA

The drainage area, in square miles, is the latest figure published or otherwise available at this time.

Under "Periods of record" are three columns. The first column, "Daily or monthly figures," shows the periods of record for continuous-record gaging stations. The dates given are the calendar years in which records began or ended; breaks of less than a year are not shown. For example, if a record began in October 1923, ended in April 1932, began again in March 1933, and ended in September 1944, the period of record would be shown as 1923-44.

The second column, "Annual peaks," shows the period of record for crest-stage partial-record stations. The dates given are the water years for which the annual maximum discharge is available. The water year begins October 1 and ends September 30. In listing the water year, only one date is shown; for example, 1952 stands for the water year October 1, 1951, to September 30, 1952.

The third column, "Low-flow measurements," shows the period of record for low-flow partial-record stations. The dates given are the water years in which base-flow measurements were made at low-flow partial-record stations; breaks of less than two years are not shown. Prior to the 1958 water year, such measurements were published in tables headed "Miscellaneous discharge measurements" or "Discharge measurements at sites other than gaging stations." Many discharge measurements have been made at miscellaneous sites which are not listed in this index because the data collected were not sufficient to qualify the site as a low-flow partial-record station.

A date followed by only a dash shows that the station was continued in operation beyond September 30, 1967. A date followed by a period indicates discontinuance, A date followed by a semicolon indicates a break in the collection of records.

Periods of record for the same continuous-record station published by other agencies are listed only when they are for periods not published in reports of the Geological Survey. These periods are indicated by symbols and footnotes. Records collected by other agencies are included only for stations for which there is some record published in Geological Survey reports.
Note.--Indexes for Alaska and Hawaii are contained in separate circulars for those States.

Figure 1.--Map of the conterminous United States showing the 14 parts covered by indexes of surface-water records to September 30, 1967. The part covered by this index is shaded.

</table>

* Gage heights, or gage heights and discharge measurements only.
+ Approximately.
+ Includes Mill Creek.
+ In reports of U.S. Weather Bureau.
+ In files of district office.
+ Includes noncontributing drainage area.
+ Approximately, includes noncontributing drainage area.
+ In U.S. Department of Agriculture, Office of Experiment Stations, Bulletin Nos. 119 and 133.
+ Below Bull Creek diversion dam.
+ Approximately, of which 48 sq mi is above Horseshoe Creek Reservoir.
+ 48 sq mi above Horseshoe Creek Reservoir.
+ Published in Texas Board of Water Engineers Bulletin 5807D.
+ Normal flow of river comes from springs, drainage area not applicable.
+ Normal flow of river formerly came from springs but now comes largely from Artesian wells; drainage area of stream not applicable.
+ Normal flow of creek comes from San Pedro Springs 2 miles upstream; drainage area not applicable.
+ In reports of Soil Conservation Service, U.S. Department of Agriculture.
r Indefinable at high stages.
s Yearly figures of diversion only.
t Approximately, includes 2,940 sq mi in closed basin in northern part of San Luis Valley, Colo.
u Yearly figures of discharge only.
v In reports of State engineer of New Mexico.
w Published in WSP 1475-I, Hydrology of Small Watersheds in Western States.
x Approximately, 2.0 sq mi has contouring, pitting, and small dams to reduce runoff.
y Published in WSP 1831, Hydrology of Cornfield Wash area and effects of land-treatment practices, Sandoval County, New Mexico.
z In files of Bluewater-Toltec Irrigation Co.
b Published in WSP 1475-I, Hydrology of Small Watersheds in Western States.
bc Periods of high flow only in Water Bulletins of International Boundary and Water Commission.
bd In reports of Pecos River Commission.
