# Index of Surface-Water Records to September 30, 1970

## Part 8.—Western Gulf of Mexico Basins

---

### INTRODUCTION

This report lists the streamflow and reservoir stations in the Western Gulf of Mexico basins for which records have been or are to be published in reports of the Geological Survey for periods through September 30, 1970. It supersedes Geological Survey Circular 578. It was updated by personnel of the Data Reports Unit, Water Resources Division, Geological Survey.

Basic data on surface-water supply have been published in an annual series of water-supply papers consisting of several volumes, including one each for the States of Alaska and Hawaii. The area of the other 48 States is divided into 14 parts whose boundaries coincide with certain natural drainage lines. Prior to 1951, the records for the 48 States were published in 14 volumes, one for each of the parts. From 1951 to 1960, the records for the 48 States were published annually in 18 volumes, there being 2 volumes each for Parts 1, 2, 3, and 6.

Beginning in 1961, the annual series of water-supply papers on surface-water supply was changed to a 5-year series, and records for the period 1961-65 were published in 37 volumes, there being 2 or more volumes for each of 11 parts and one each for parts 10, 13, 14, 15 (Alaska), and 16 (Hawaii and other Pacific areas). These part boundaries and the volumes within each part are shown on a map (Figure 1). Records for the 5-year period 1966-70 will be published in a similar series of water-supply papers. District offices of the Water Resources Division, Geological Survey, have also issued interim annual reports since 1961 to meet immediate local needs for streamflow records within the State or States comprising the district.

Records prior to 1951 for the Western Gulf of Mexico basins are summarized in Water-Supply Paper 1312, and those from 1951 to 1960 are summarized in Water-Supply Paper 1732; each of these summaries lists the earlier publications in which more detailed information was published. Records for 1961-65 are published in Water-Supply Paper 1922, and 1923; those for 1966-70 will be published in Water-Supply Papers 2122, and 2123.

In addition to the continuous-record gaging stations, this index includes crest-stage and low-flow partial-record stations. A continuous-record station is a gaging station on a stream or reservoir for which the discharge, stage, or contents is published on a daily, weekly, or monthly basis for a continuous period of time. A crest-stage partial-record station is a streamflow station for which only the annual maximum discharge is published over a period of years for use in floodflow analyses. A low-flow partial-record station is a streamflow station for which only discharge measurements made at base flow, when streamflow is primarily from ground-water storage, are published; measurements are generally collected over a period of five years or more for use in low-flow analyses. Discharge measurements have been made at many sites and published as miscellaneous measurements; such measurements are not included in this index except those made in earlier years at sites now classified as low-flow partial-record stations.

Explanation of reference marks is given at the end of the index.

An alphabetical list of streams, lakes, and reservoirs is given at the end of this circular.

### DOWNSTREAM ORDER

The stations in this index are listed in the downstream order used in the series of water-supply papers on surface-water supply of the United States since 1951. Starting at the headwater of each stream, all stations are listed in a downstream direction. Tributary streams are indicated by indentation (one indentation of two spaces for each rank) and are listed between main-stem stations in downstream order as they enter the main-stem stream. Likewise, streams of less important rank are listed similarly in downstream order as they enter between stations on the stream of more important rank. If station names fail to show the complete sequence of tributaries and ranks, a stream name only is inserted to complete the series unless that series is complex and undetermined, in which case a double indentation (four spaces) is used to indicate that the ranking of tributaries is incomplete.

## STATION NAME

Station names are given in their most recently published form. Parentheses around part of a station name indicate that the enclosed word or words were used in an earlier published name of the station or as an alternate name. Parenthetical explanations are also used to indicate that a stream of a different name is the head of the main stream by use of "(head of \_\_\_\_\_ River)" and that the name of the main stream has changed by use of "(continuation of \_\_\_\_\_ River)."

## STATION NUMBER

As an added means of identification, each continuous- and partial-record station has been assigned a station number. The numbers have been assigned in the same downstream order used in this index. In assigning station numbers, gaps were left to allow for new stations that may be established; hence the numbers are not consecutive. The complete number for each station consists of 8 digits. The first 2 digits represent the part number and the last 6 the station number. For example, the complete number for a station in this part would be 08294000.

## DRAINAGE AREA

The drainage area, in square miles, is the latest figure published or otherwise available at this time.

## PERIODS OF RECORD

Under "Periods of record" are three columns. The first column, "Daily or monthly figures," shows the periods of record for continuous-record gaging stations. The dates given are the calendar years in which records began or ended; breaks of less than a year are not shown. For example, if a record began in October 1923, ended in April 1932, began again in March 1933, and ended in September 1944, the period of record would be shown as 1923-44.

The second column, "Annual peaks," shows the period of record for crest-stage partial-record stations. The dates given are the water years for which the annual maximum discharge is available. The water year begins October 1 and ends September 30. In listing the water year, only one date is shown; for example 1962 stands for the water year October 1, 1961, to September 30, 1962.

The third column, "Low-flow measurements," shows the period of record for low-flow partial-record stations. The dates given are the water years in which base-flow measurements were made at low-flow partial-record stations; breaks of less than two years are not shown. Prior to the 1958 water year, such measurements were published in tables headed "Miscellaneous discharge measurements" or "Discharge measurements at sites other than gaging stations." Many discharge measurements have been made at miscellaneous sites which are not listed in this index because the data collected were not sufficient to qualify the site as a low-flow partial-record station.

A date followed by only a dash shows that the station was continued in operation beyond September 30, 1970. A date followed by a period indicates discontinuance. A date followed by a semicolon indicates a break in the collection of records.

Periods of record for the same continuous-record station published by other agencies (or available only in files of the Geological Survey or another agency) are listed only when they are for periods not published in reports of the Geological Survey. These periods are indicated by symbols and footnotes. Records collected by other agencies are included only for stations for which there is some record published in Geological Survey reports.

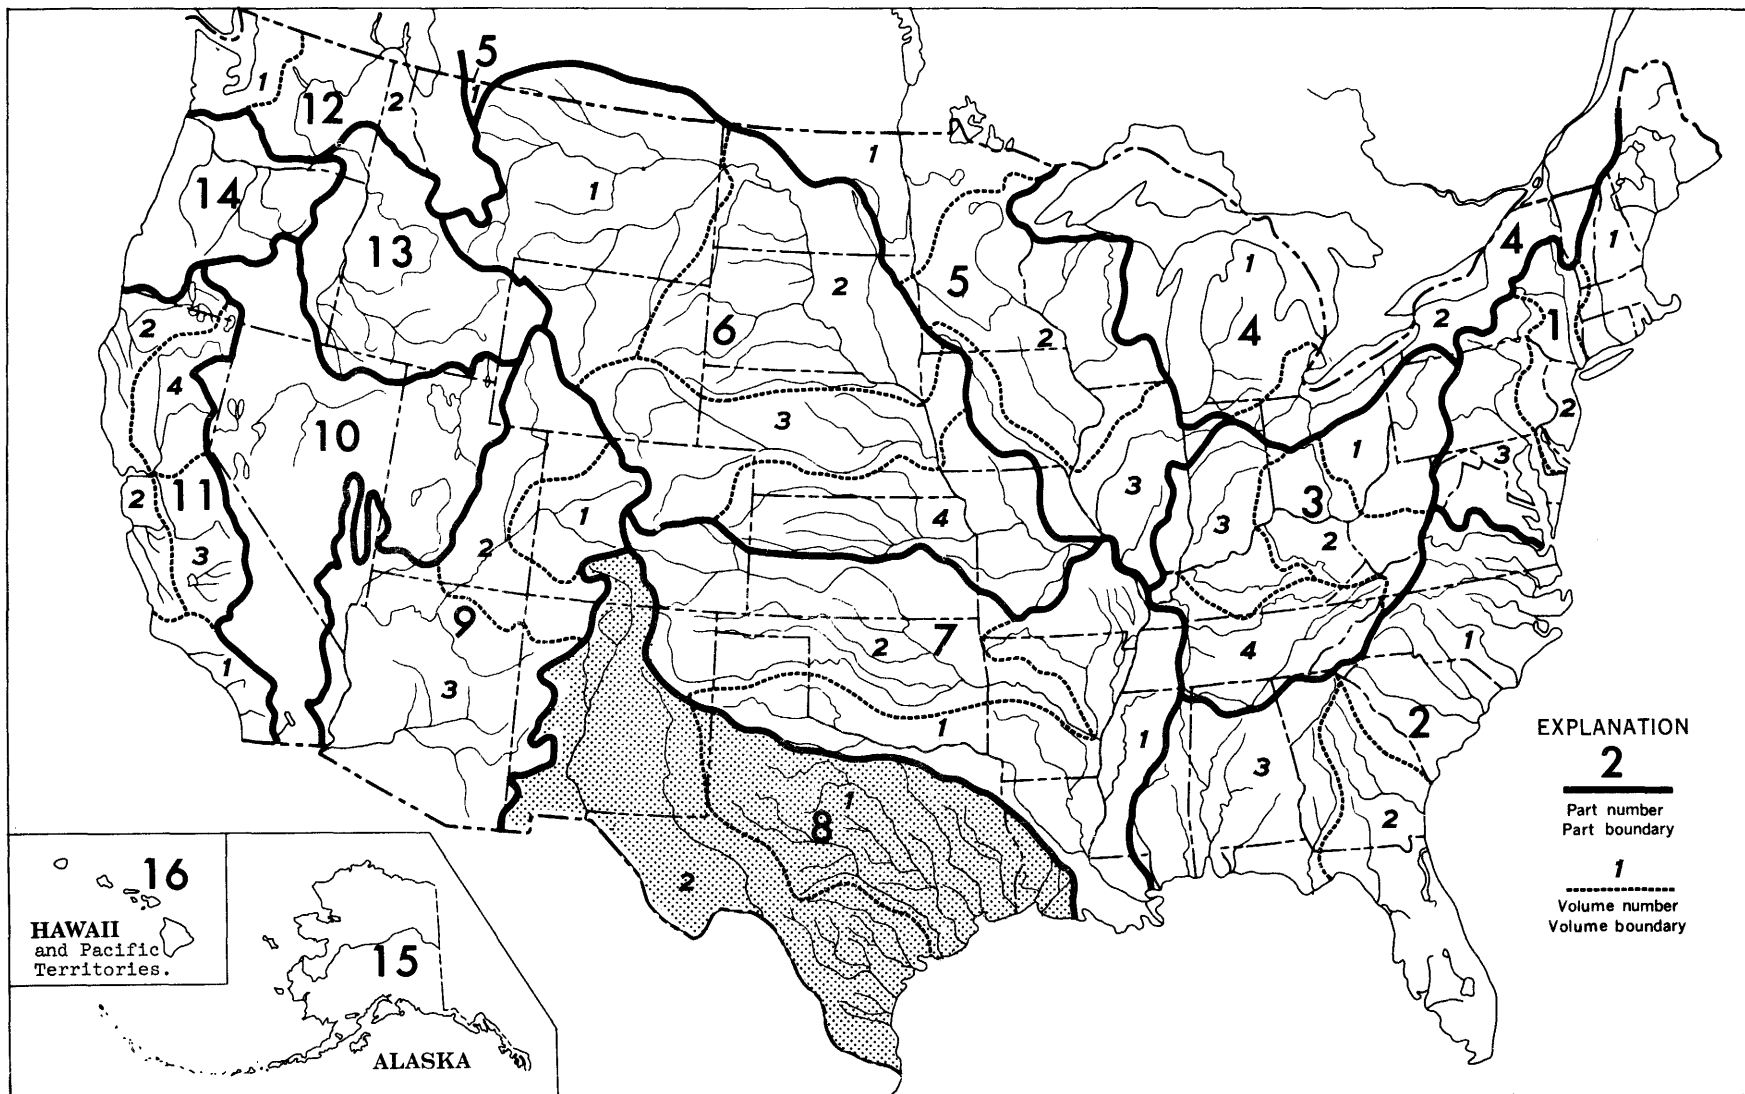

Figure 1.--Map of the United States showing area covered by the volumes in the series on surface-water supply. The area covered by this index is shaded.

Station name	Station number	Drainage area (sq mi)	Periods of record		
			Daily or monthly figures (calendar years)	Annual peaks (water years)	Low-flow measurements (water years)
WESTERN GULF OF MEXICO BASINS					
MERMENTAU RIVER BASIN					
Bayou des Cannes (head of Mermentau River):

Swingle Canyon near Datil, N. Mex.....	08500000	6.35	.....	1970-	

\* Gage heights, or gage heights and discharge measurements only.

a Approximately.

b Includes Mill Creek.

c In reports of U.S. Weather Bureau.

d In files of district office.

e Includes noncontributing drainage area.

f Approximately, includes noncontributing drainage area.

g In U.S. Department of Agriculture, Office of Experiment Stations, Bulletin Nos. 119 and 133.

h Since 1954 all flow from 426 sq mi (some noncontributing) diverted to Lake J.B. Thomas.

i Approximately, of which 48 sq mi is above Hords Creek Reservoir.

j 48 sq mi above Hords Creek Reservoir.

k Published in Texas Board of Water Engineers Bulletin 5807D.

m Normal flow of river comes from springs; drainage area not applicable.

n Normal flow of river formerly came from springs but now comes largely from artesian wells; drainage area of stream not applicable.

p Normal flow of creek comes from San Pedro Springs 2 miles upstream; drainage area not applicable.

q In reports of Soil Conservation Service, U.S. Department of Agriculture.

r Indefinable at high stages.

s Yearly figures of diversion only.

t Approximately, includes 2,940 sq mi in closed basin in northern part of San Luis Valley, Colo.

u Yearly figures of discharge only.

v In reports of State engineer of New Mexico.

w Published in WSP 1475-I, Hydrology of Small Watersheds in Western States.

x Approximately, 2.0 sq mi has contouring, pitting, and small dams to reduce runoff.

y Published in WSP 1831, Hydrology of Cornfield Wash area and effects of land-treatment practices, Sandoval County, New Mexico.

z In files of Bluewater-Toltec Irrigation Co.

bb Yearly figures of contents only.

bc In Water Bulletins of International Boundary and Water Commission.

bd In reports of Pecos River Commission.

be Periods of high flow only in Water Bulletins of International Boundary and Water Commission.
