

Figure 6. Fluvial tailings deposit in the Eureka to Maggie Gulch reach, upper Animas River. These deposits accumulated in settling ponds below the Sunnyside Mill at Eureka during the flotation era of milling (1918–1930). Note the very high concentrations of deposit-related trace elements in these deposits (Fey and others, 2000). Sunnyside Gold Corp. moved these deposits to the Mayflower Mill repository below Howardsville during their remedial work in the reach during 1996.
