PHYSICAL DESCRIPTION

0 - 82 cm (CL)
 Top 30 cm of sub unit a mix of sand, mud and silt. Deformation is not present and bedding appears to be massive without traces of organics or bioturbation. 30 - 82 cm, mostly laminated muds brown to grey in color.

82 - 407 cm (ML)
 Inter bedded SANDS, silts and clays. Beds are horizontal and have an avg. thickness of 0.5-1.0 cm. The muds are grey to dark grey and the sands are tan in color. Deformation is present from 190 - 210 cm. Organics in the form of coffee grounds substitute for a lamanea at 204, 236, 296, 324-328 and at 352-356 cm. Bioturbation is mostly absent, but burrows are present at 148, 178, 250 and a mild bioturbated zone at 258-261 cm. The sub unit becomes sand rich as you move to the bottom and the bedforms also change from horizontal to wavy to massive.

0' - 2.69' (CL) 2.69' - 13.35' (ML)
