

DIX-OT -3  
#1 Hazel Langsdon  
Core Description

- 6        3211-20      Bottom- Argillaceous sand, F-grn, A-SA, WS,  
Trace glauc, yellow-stained sand. 40% dark olive  
clay matrix. Soft, slight fissility. Lower Atkinson
- 7        3220-30      Top- Laminated clay, dk-grey with olive cast, V.  
finely micaceous and ashy with sand as 3211-20 but  
ashy and micaceous. Bottom- M-grey fine-grained  
silty sand, just enough silt to bind. Tr F-grn mica.
- 8        3230-40      Do. Highly glauc & micaceous. Thin laminae of  
black shale in middle. Bottom- M-grey fissile hard  
shale. ("Poker chip" shale)
- 9        3240-50      Top- sand, white, F-grn, WS, unindurated. Tr F-grn  
red sub-oolitic hematite, chips of lt-grey shale. Matrix  
SL. Calc.
- 10      3250-60      Do. Much ochre-color clay in bottom of interval.
- 11      3619-21.5     V. sandy LS. Sand 70% F (mostly) to m-grn, SR-R.  
Rock purple to white to yellow. Tr white quartzite,  
V. hard (Paleozoic contact?)
- 13      3646.5-47.5   Quartzite, lt-grey, V hard and dense, pyritic.
- 14      3668-71      Top - Quartzite do.  
Middle- Shale, brown, V- highly micaceous, hard.  
Bottom. White VF-grn quartzite with V. thin  
laminae of shale as middle of interval.

Report on samples studied from the Sun Oil Company #1 Hazel Langston, Dixie County, Florida.

- 1894 - 1900  
Top of Lower Lawson*
- 1700 - 10' Top of Upper Lawson. Tan, crypto-crystalline, highly gypsiferous limestone; a few pitted areas.
- 1710 - 20' Like the preceding; a few sections of molds of Orbitoides? and fragments of impressions of other micro-fossils.
- 1720 - 30' Light cream, porous, granular, chalky gypsiferous limestone, apparently originally a coquina of small micro-fossiliferous molds and fragments.
- 1730 - 60' Like the preceding.
- 1760 - 70' Tan, finely porous, finely granular or minutely globular, highly gypsiferous limestone; some free gypsum.
- 1770 - 90' Like the preceding.
- 1790 - 1800' Similar to the above; much less porous, granular texture, less distinct.
- 1800 - 60' No change.
- 1860 - 70' Light tan, gypsiferous, chalky limestone.
- 1870 - 80' Tan, succose, slightly pitted gypsiferous dolomite.
- 1880 - 90' No change.
- 1890 - 1900' Same and at least 50% cavings.
- 1900 - 10' <sup>21st Jan 1950</sup> Top of Lower Lawson Light tan, gypsiferous chalk; some fragments Echinoid spines (Lower Lawson type)
- 1910 - 20' White chalk, similar to above in character; some species of Lepidorbitoides in chalk fragments.
- 1920 - 50' No change.
- 1950 - 60' Softer white chalk, many fragments of Lepidorbitoides, Echinoid spines, some Bryozoans, specimens of Cibicides harperi.

- 2010 - 50' ~~fauna mainly Anomalina cosdeni, Bryozoans, and small Cibicides harperi.~~
- 2050 - 60' No change.
- 2060 - 70' Gypsiferous dolomite as at 2020 - 30'.
- Notes:  
On Lower  
Lawson  
Section
- Section continues as alternating lenses of gypsiferous dolomite and chalk with fauna similar to that listed above, some small Brachiopods and the characteristic, disk-shaped ~~Brachiopod~~ or Algae? Robulus species (common to the Lower Lawson) added to the fauna. A few Inoceramus fragments came into material about 2180'. Large specimens of Cibicides harperi and some increase in number of Echinoid fragments first noted at 2230'; first specimens of Bolivina incrassata at 2250'. Some specimens of Globotruncana arca also present in this part of section.
- 2310 - 20'  
Top of  
Taylor
- White chalk and a few fragments of the typical gray (Lower Lawson-Taylor contact) bentonitic sh., many Inoceramus fragments and prisms. Many specimens of the large variety of Cibicides harperi and Bolivina incrassata, some specimens of a slightly ornamented variety of Anomalina cosdeni, Stensioina americana, Globorotalia micheliniana, Planulina cedarkeysensis and others.
- Typical Anomalina cosdeni comes into the section a short distance below the top of the Taylor.
- Large anhydrite crystals in chalk first noted at 2500 - 10'. Increase below this depth.

Section 8-8S-14E  
Dixie County, Florida  
Elevation: 33' D.F.  
Report By: E. R. Applin  
Date: August 1947

Herewith report on samples studied from the Sun Oil Company #1 Hazel Langstone, Dixie County, Florida

- 2650-60 Cut of mod soft white chky ls & about 25% frags of fine grnd lt tan-gray dol. Many Inoceramus frags. A few forams. No narrowly restricted species noted.
- 2660-70 Like the preceeding, with the addition of a few frags of brn-gy marly sh & very little dol.
- 2670-80 No change.
- 2680-90 Cuttings of wh mod soft chky ls. Many Inoceramus frags & some frags of an ~~Ostrea~~-like bivalve very few forams, no diagnostic species.
- 2690-2700 and 2700-10', No change.
- 2710-20 Similar to above. Some frags of ls at this depth highly pyritic.
- 2720-30 Cuttings of wh chky ls, many Inoceramus frags, a few frags of gy marly sh & a few of fine grnd dol. Few forams washing free.
- 2730-40 No change and (2740-50') - (2750-60')
- 2760-70 Approx top of Austin. Like the above, also a few frags of brn-gy ~~somewhat~~ wh speckled marly sh, common to portions of Austin sections in this area.
- 2770-80 Like the preceeding and (2780-90) - (2790-2800').
- 2800-10 Cuttings of soft, wh chky ls ~~ls~~ and abundant Inoc. frags & prism, many of these pyritized. Few forams.
- 2810-20 Like the above.
- 2820-30 Like the above. A few of the chky ls frags very highly micro-fos. forams and frags of larger fos.
- 2830-40 Frags of the chky ls & Inoceramus frags as above, also many frags of gy somewhat wh strkd and spotted marly sh.
- 2840-50 No change.
- 2850-60 Similar to above, but poor sample, highly iron-stained from drilling frags.
- 2860-70 Like the preceeding.
- 2870-80 Similar to above. Abundant cavings.
- 2880-90 White & lt gy and brnsh gy ls & some marly sh. Abundant Inoceramus frags & prisms, some forams.
- 2890-2900 Like the above, some frags of darker gy & brnsh gy somewhat wh speckled marl also present.
- 2900-10 Similar to above, but gray and brnsh gy, "Speckled" marl frags about 50% of the sample.
- 2910-20 No change & (2920-30') &(2030-40) (2940-50) (2050-60)(2960-70).
- 2970-80 Materials as above-specimens of *Globotruncula*, *Globigiglina* & Gum-

3030-40

Gray & brnish gy "speckled" marl as above - also many frags of a wh chlky ls which contains abundant small calcite molds of forams and small calcitic frags of other fossils and scattered crystals of dol. Some cavings of wh ls & other materials from higher depths.

3040-50

Wh ls as above, some cavings & some frag of a dark brn, "speckled", thinly laminated sh.

3050-60

Cuttings of wh ls including many frags of the highly micro fes ls noted at 3030-40 & about 50% frags of gy "speckled" marl. Similar to the above. Gray and dk brnsh gy "speckled" marl about 75% of sample.

3070-80

Like the preceeding, Globigerina and Gumbelina reussi fairly common and some specimens of Gumbelina moremani and Eouvigerina aculeata present.

3080-90

Sample mainly composed of frags of gy and brn gy "speckled" marly sh. Fauna poor, similar to above.

3090-3100

Speckled sh as above, also abund frags of a cream to tan colored hd ls which is a mass of calcite particles (fos broken & calcitered fos mat). This ls seems to be also slightly finely sandy and shows some irreg strks of blk (carbonaceous?) residue.

3100-10

Like the preceeding.

3110-220

*L. Atkinson  
E. Horn*  
E.F. break. Cut of mod hd, very finely sandy lt tan-gy ls & sand frags of (prob. lenticular) a gy, cal ss, s grnd very fine to mod fine in size. Occasional frags of the ls show clusters of qtz crystals. Some veins of various sized quartz crystals also represented in the cutting frags.

3120-30

Cut of very finely sandy crm colored ls as above.

3130-40

Cut of s ls as above & frags of a gy "speckled" sh. This shale somewhat dif in color & texture from that noted above the "break". Sample small suggesting that the sh is the material being drilled. Many specimens of Plan eaglefordensis present.

3140-50

Cut sample composed almost entirely of gy somewhat lt speckled marl; specimens of Globigera, Planulina eaglefordensis and Gumbelina moremani noted.

3150-60

Sh as above & about 50% very fine grnd crm & tan colored cal ss.

3160-70

As above, also some cavings from higher depths. Forams abundant. Globigerina & Gumbelina dominant. Planulina eaglefordensis present.

3170-80

Cuttings of gray impact "speckled" sh, some frags of very fine grnd tan colored cal ss. forams present, but much less abundant.

3180-90

Cuttings of dk gy somewhat lt speckled sh & fine grnd ss as above. Fauna same as above. Also some frags of a gy fine to nod fine grnd slightly glauc ss. Break (?).

3184-87

*L. Atkinson*  
Core, Rec. 2'. Glauc ss. Top: Soft gy fine to nod fine grnd glauc non-cal ss.

Bottom: Like the above, s is angular to sub-angular, little clay matrix, some phos bone frags present.

3187-91

Core, Rec. 18", Top: Gy, somewhat lt speckled marl as above the glauc ss & a little ss as above. Some specimens of Glob cf. cretacea present. (Is this really a part of a core?).

Bottom: Soft fine to nod fine, sub-ang grnd argil glauc ss.

present.  
Second: ss as above & what looks like a frag of a large chalk nod. (I question the authenticity of the position of this nod).  
Third 15": Dark grnish gy, argil, glauc & somewhat phos fine to nod fine grnd sub-angular qtz ss.  
Bot 25": Smooth, gray, thinly laminated somewhat finely mica sh with irreg sandy areas. Shale is non-cal. Pos. some lenses of gy argil & phos glauc ss. No fossils other than phos. bone frags. (from ss) noted.

3201-11 ↘ Top 30": Soft gy fine to nod coarse grnd glauc argil & somewhat phos ss. Some thin lenses of flaky sh as above.  
Bot 20": Gy, non-cal flaky somewhat finely mica sh. Sh has some irreg glauc sandy areas. No fossil material other than a few phos nods noted.

3211-20 ↙ Rec. 9'. Top: Soft gy mainly fine grnd argil & somewhat glauc ss. A little phos material also present. A frags of gray clay sh slightly glauc also present. Prob represents a shale lense in the ss..

Mid: Gy, soft, argil glauc & somewhat mica ss. Sand grains mainly fine.

Bot: Thinly flaky gray, mica sh with thin & irreg lenses of fine grnd glauc s. The sh shows some small frags of carb mat.

3220-30 7 Core, Top 2': Thinly laminated gy sh with some lenses of lt gray glauc & somewhat mica, argil very fine grnd ss.

Sec. 2': Thinly laminated gray sh. The sh has irreg sandy areas and is also interbedded with thin lenses of glauc & somewhat mica fine grnd ss. A few small frags of phos mat also noted in the ss.

Third 2': Irreg lenses of sh & fine grnd glauc & mica ss as above. Some small frags of carb mat.

Fourth 2". Fine grnd, argil mica & glauc ss with some thin lenses of gray sh & some frags of carb mat.

Bot 2": Irreg lenses of sh & ss as above.

3230-40 8 Top 3': Like the above.

Sec. 3': Lt gy fine to nod fine grnd glauc & slightly phos, somewhat mica ss.

Third 14": Gy, thinly laminated sh with some irreg silty & mica, slightly finely carb lenses.

Fourth 20": Gray, thinly laminated finely mica cal sh. Some small frags of carb mat & a trace of glauc.

Bot 9". L. Cret Break. Top of L. Cret. White, non-cal highly argil very fine grnd ss, or sandy clay .Matrix & s each about 50% of core. S is fine grnd qtz with some pink tinted grnd.

Core, Top: Like the preceding.

Mid: mat mush less argil & slightly coarser grnd.

Bot: Like the preceeding.

3250-60 10 Top 2": No change.

Sec. 2": "

Third 2": Bright mustard colored argil fine grnd ss similar to preceeding in character. Chor due to clay matrix.

Bot 2": White siltstone with irreg yellow brown mottling.

- 3280-90 argil ss & nod fine grnd loose sand.  
No change.
- 3290-3300 Cut mainly mod fine s & cavings from higher depth. Coarse frags of deep brownish yellow & red fine grnd very dense quartzitic ss. A few small frags of a pink, very fine grnd argil ss.
- 3300-10 Mainly cavings of gy sh & fine to nod fine loose s. Some mustard colored and white argil ss nodules.
- 3310-20 Like the preceding. A few frags of raspberry colored finely sandy clay.
- 3320-30 Cavings of gray sh about 50% fine to med fine loose sand & frags of wh, mustard colored and pink, argil ss. Coarse frags of the yellowish brown quartzite like ss.
- 3330-40 Mainly cavings & fine to nod fine loose sand..
- 3340-50 Like the preceding.
- 3342 S.W. Core, soft, very fine grnd, white & deep yellowish tan mottled argil ss.
- 3350-60 Cavings (mainly of gy sh) fine loose sand and a few frags of very fine grnd wh argil ss.
- 3362 S.W. Core. Lt reddish brn, fine grnd argil ss.
- 3360-70 Cavings mainly of gy sh and fine sand. A few frags of wh & deep mustard colored argil very fine grnd ss.
- 3370-80 Cavings about 50%, remainder frags of crm colored fine to mod fine grnd ss, some frags of yellow argil ss. A few frags of pink argil ss.
- 3380-90 Cavings of sh from higher depths and about 50% fine to coarse loose sd, coarse grns abundant. Some nod, frags of wh, dark red-brn and grnish yellow argil ss.
- 3390-3400 Like the preceding.
- 3400-10 Similar to above but coarse sand grnd must less abundant & a number of frags of finely & highly sand mustard colored clay sh.
- 3410-20 Like the preceding, some frags of mustard & red mottled sandy clay sh.
- 3420-30 No change.
- 3428 S.W. Core. Fine grnd, reddish brn soft argil ss.
- 3430-40 Definite cavings about 50%, remainder fine to coarse sand and frags of purplish red & mustard colored finely sandy sh.
- 3440-50 No change.
- 3450-60 Cavings, fine sand (some coarse grns.) frags of brn, red-brn & mustard colored finely s. clay sh & fine grnd nod. of ss in same colors.
- 3460-70 Like the preceding.
- 3462 S.W. Core, Soft white argil fine to mod fine grnd ss.
- 3470-80 Cuttings, mainly fine to nod fine loose sd, some frags of sdy, deep mustard colored clay. (Appears to be nodular.) Some frags of fine grnd, wh, argil ss.
- 3480-90 Fine loose sd. Some deep mustard colored & brnish red, argil & sdy nods. Some definite cavings.
- 3490-3500 Fine sand, some coarse grns & many frags of mustard colored & some red-brn highly sandy clay.
- 3500 S.W. Core, Lt reddish tan, soft, argil fine grnd ss.

- 3420-30 Fine to very coarse sand (some frags of small pebble size) frags of finely sandy mustard colored clay sh, some mustard colored, wh & reddish brn mottled sd clay sh. Abut 50% of sample cavings of materials from higher depths.
- 3530-40 L. Break. Mottled wh & mustard colored, (a few pink stks) hard, cal ss or sd & dol ls. Sand content about 50%, but irreg distributed, fine grnd, some cavings as above.
- 3540-50 Cuttings of materials like the preceding hd, cal, mot. yellow and wh ss (much cement) frags of purplish red & wh, finely sdy clay sh, some loose sand & cavings.
- 3550-60 Similar to preceding but sd sh frags relatively more abundant.
- 3552 S.W. Core. Yellow & wh mottled, argil fine grnd soft ss.
- 3560-70 Cuttings of red, blue & mustared, finely sd clay sh. Frags of lt purplish red & wh finely sd hard cal material (hard dol ls?)
- 3570-80 Fine loose sd & cavings from much higher depths.
- 3570-80 Cuts of fine grnd wh ss of pink & wh & some yellow mottled sdy ls & cal ss & some finely sdy mustared & red brn shaly clay. Some obvious cavings.
- 3580-90 Cuttings composed mainly of frags of hd, dense, wh & light raspberry colored, sandy cal rock. (Mat everv~~sses~~ somewhat, looks like ls & is hd, matrix about 50% of material). Many frags of wh & yellow, slightly cal soft ss. Some mottled raspberry, yellow & white sandy clay. Some cavings. The material which looks like a sdy ls may be in part dolomitic.
- 3590-3600 Like the preceding.
- 3600-10 As above. A few frags of gy of white & of deep yellow quartzite(?) or very dense hd ss.
- 3610-15 Cuttings of yellow & wh, nodular? dolomitic? ls & frags of a dense fine grnd deep yellow ss, some ss frags light bluish grn and some wh. Some frags of mottled sandy clay. A few frags of white quartzite?). Break?
- 3615-20 Similar to above with frags of very hd, dense, fine grnd wh ss relatively more abundant.
- 3619-21 || Core, Rec. 18". "Boulder conglomerate." Very hd dense, fine, lt blue-grn, deep yellow & purplish mottled ss. Large frags of wh & yellow fine grnd quartzite.
- 3620-25 Cuttings composed mainly of frags of a very dense, fine grnd (quartzite-like) ss in wh, blue grn, deep yellow, yellow brown & brnish red. Some frags of vary colored dolomitic, nodular? ls & sdy ls as above & some obvious cavings of material from higher depths, some loose sand.
- 3625-30 No change.
- 3630-35 ~~Pel~~ Small sample, no change.
- 3635-40 Mainly gy & wh dense, fine grnd, somewhat mica ss. Other material noted above also present.
- 3640-45 Like the preceding more micaceous. Some lt bluish grn, mica ss & a few frags of mica lt blue grn sh.
- 3646-47 Core. Rec. 3". Very hd lt gy quartzite with many small inclusions of amorphous gold colored pyrite.
- 3645-50 Paleozoic. Cuttings compared mainly of frags of hd, dense, mica,

- 3650-72 Like the above, shale frags more abundant.
- 3655-60 Cuttings strongly dominated by frags of fine grnd, dense, hard white ss.
- 3660-65 Cuttings compared mainly of hd wh & of lt grnish gy, somewhat mica ss.
- 3665-70 Like the above. Some frags of a hd dk brn, schist(?)
- 3668-71 14 Core. Rec. 2 1/2'. Top: Lt gy quartzite with thin dark brnish gy highly mica schistose lense, ss is lt gy to lt grnish gy, mica, thinly laminated.
- Mid: Brnish blk, thinly laminated very highly mica sh. The highly mica portions of the core seem to be in thin lenses, strkd thru the much less mica sh.
- Bot: Like the top.
