

The 3D Elevation Program—Summary for South Dakota

Introduction

Elevation data are essential to a broad range of applications, including forest resources management, wildlife and habitat management, national security, recreation, and many others. For the State of South Dakota, elevation data are critical for agriculture and precision farming, natural resources conservation, water supply and quality, infrastructure and construction management, flood risk management, geologic resource assessment and hazard mitigation, and other business uses. Today, high-density light detection and ranging (lidar) data are the primary sources for deriving elevation models and other datasets. Federal, State, tribal, and local agencies work in partnership to (1) replace data that are older and of lower quality and (2) provide coverage where publicly accessible data do not exist. A joint goal of State and Federal partners is to acquire consistent, statewide coverage to support existing and emerging applications enabled by lidar data.

The National Enhanced Elevation Assessment (NEEA; Dewberry, 2011) evaluated multiple elevation data acquisition options to determine the optimal data quality and data replacement cycle relative to cost to meet the identified requirements of the user community. The evaluation demonstrated that lidar acquisition at quality level 2 (table 1) for the conterminous United States and quality level 5 ifsar data (table 1) for Alaska with a 6- to 10-year acquisition cycle provided the highest benefit/cost ratios. The new 3D Elevation Program (3DEP) initiative (Snyder, 2012a,b) selected an 8-year acquisition cycle for the respective quality levels. 3DEP, managed by the U.S. Geological Survey (USGS), the Office of Management and Budget Circular A-16 lead agency for terrestrial elevation data, responds to the growing need for high-quality topographic data and a wide range of other 3D representations of the Nation's natural and constructed features.

3DEP in South Dakota by the Numbers

Expected annual benefits	\$11.26 million
Estimated total cost	\$25.74 million
Payback	2.3 years
Quality level 1 buy-up estimate	\$16.38 million

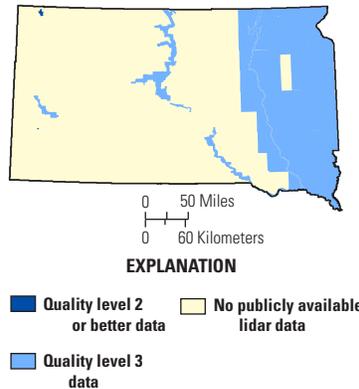

Figure 1. Map of South Dakota showing the areal extent and quality levels of planned and existing publicly available light detection and ranging (lidar) data in August 2013. Quality level 2 or better lidar data meet 3DEP requirements. See table 1 for quality level information.

3D Elevation Program Benefits for South Dakota

The top 10 South Dakota business uses for 3D elevation data, which are based on the estimated annual conservative benefits of the 3DEP initiative, are shown in table 2. The NEEA survey respondents in the State of South Dakota estimated that the national 3DEP initiative would result in at least \$11 million in new benefits annually to the State. The cost for such a program in South Dakota is approximately \$26 million, resulting in a payback period of 2.3 years and a benefit/cost ratio of 3.5 to 1 over an 8-year period. Because monetary estimates were not provided for all reported benefits, the total benefits of the 3DEP to South Dakota are likely much higher. On the basis of the NEEA survey results, all levels of government and many organizations in South Dakota could benefit from access to statewide high-resolution elevation data.

For South Dakota, approximately 84 percent of the identified business use requirements will be met primarily in agriculture and precision farming and natural resources conservation uses alone, as shown in table 2. The status of publicly available lidar data in South Dakota is shown in figure 1. By enhancing coordination between the 3DEP and various government and private organizations in South Dakota, it may

3D Elevation Program

3DEP is a national program managed by the USGS to acquire high-resolution elevation data. The initiative is backed by a comprehensive assessment of requirements (Dewberry, 2011) and is in the early stages of implementation. 3DEP will improve data accuracy and provide more current data than is available in the National Elevation Dataset (NED). The goal of this high-priority cooperative program is to be operational by January 2015 and to have complete coverage of the United States by the end of 2022, depending on funding and partnerships. 3DEP can conservatively provide new benefits of \$1.2 billion/year and has the potential to generate \$13 billion/year in new benefits through improved government services, reductions in crop and homeowner losses resulting from floods, more efficient routing of vehicles, and a host of other government, corporate, and citizen activities (Dewberry, 2011). A shared, common elevation dataset would foster cooperation and improve decisionmaking among all levels of government and other stakeholders.

Benefits of a Funded National Program

- Economy of scale—Acquisition of data covering larger areas reduces costs by 25 percent.
- A systematic plan—Acquisition of data at a higher quality level reduces the cost of “buying up” to the highest levels needed by State and local governments.
- Higher quality data and national coverage—Ensure consistency for applications that span State and watershed boundaries and meet more needs, which results in increased benefits to citizens.
- Increase in Federal agency contributions—Reduces State and local partner contributions.
- Acquisition assistance—Provided through readily available contracts and published acquisition specifications.

be possible to realize more than the cited conservative benefits and attain the higher potential benefits for many business uses.

The following examples highlight how 3DEP data can support business uses in South Dakota: (1) Approximately 90 percent of the land area of South Dakota is devoted to agricultural uses. Enhanced elevation data can provide a more accurate depiction of terrain and dramatically improve precision farming activities (fig. 2), which helps improve crop yields, prevent soil degradation, minimize groundwater usage, and reduce agricultural chemical runoff—factors that help farmers realize a larger return on their investments. (2) Enhanced elevation data could enable State, regional, tribal, and local governments to more effectively implement natural resources conservation practices while providing additional cost savings to the public. If lidar data were available nationally, public and private organizations would expand their use of lidar for planning and site-level engineering to reduce field work for conservation ponds, grassed

waterways, pipelines, terracing, accurately calculating runoff, identifying historic wetlands (drained), and wetland restoration.

Table 2. Conservative benefits for the top 10 business uses of the proposed 3DEP data identified in the National Enhanced Elevation Assessment for South Dakota (Dewberry, 2011).

Rank	Business use	Annual benefits (millions)
1	Agriculture and precision farming	\$6.39
2	Natural resources conservation	3.07
3	Water supply and quality	0.64
4	Infrastructure and construction management	0.48
5	Flood risk management	0.33
6	Geologic resource assessment and hazard mitigation	0.15
7	Renewable energy resources	0.09
8	Aviation navigation and safety	0.06
9	Forest resources management	0.02
10	River and stream resource management	0.02
	Other	0.01
	Total	11.26

3D Elevation Program—Continued

The USGS and its partners will acquire quality level 2 or better (table 1) 3D lidar data over the conterminous United States, Hawaii, and the U.S. territories. Interferometric synthetic aperture radar (ifsar) data are being collected at quality level 5 (table 1) in Alaska. The data will be acquired over an 8-year period and will be made available to the public. By using this acquisition scenario, a number of high-quality elevation-data products can be created to serve a wide range of business uses in government and the private sector.

Table 1. Data quality levels used in the National Enhanced Elevation Assessment (Dewberry, 2011).

[≤, less than or equal to]

Quality level	Nominal pulse spacing (meters)	Vertical accuracy (centimeters)
1	0.35	9.25
2	0.7	9.25
3	1–2	≤18.5
4	5	46–139
5	5	93–185

Next Steps for Implementing 3DEP

Accomplishing the 3DEP initiative's goal of national coverage in 8 years depends on the following factors:

- Increased partnerships among Federal, State, tribal, and local governments.
- Partnerships that acquire elevation data to the program's specifications across larger project areas.
- Increased communication about and awareness of the program's benefits and goals.
- Support for the program from government and other stakeholders.
