On March 23, 2014, the World Health Organization (WHO) made the first announcement of what would become the largest Ebola virus disease (EVD) outbreak since the discovery of the disease in West Africa in 1976. At the forefront of world news regarding the deadly virus were Guinea, Liberia, and Sierra Leone, the three countries most affected by the EVD outbreak (World Health Organization, 2014). Projected economic growth for these three countries in 2014 and 2015 had hinged on the expected development of their respective mineral sectors, which play a significant role in the economy of all three countries in terms of the contribution to the gross domestic product (GDP) and to export revenues. The mineral sector, in particular the iron ore industry, has played a significant role in the economic growth experienced by Liberia and Sierra Leone in recent years. Uncertainty regarding the status of mining and mineral exploration operations in the three countries following the onset of the EVD outbreak and changes in mineral market conditions raised questions regarding the prospects for such growth and future foreign direct investment in the region (World Bank Group, 2014). Figure 1 shows the total number of reported EVD cases as of yearend 2014, and the geographic location of active mining operations and mineral facilities in Guinea, Liberia, and Sierra Leone.

This fact sheet provides data and information about (1) the mineral sectors of Guinea, Liberia, and Sierra Leone and the importance of the sector to the economy of each country; (2) the distribution of mines and mineral facilities, projects in development, and reported EVD cases; and (3) potential risks of the outbreak to investment in and development of new mines, processing facilities, and related mineral industry infrastructure.

**Figure 1.** Active mining operations and mineral processing facilities in Guinea, Liberia, and Sierra Leone and reported cases of Ebola as of yearend 2014. Numbered facility labels correspond to entries in table 2. District-level Ebola virus disease data derived from World Health Organization (2014, 2015) data as of December 2014.
Background

Guinea, Liberia, and Sierra Leone’s shared histories of civil unrest and related economic disruptions have served as deterrents to the development of the mineral sector in each of these countries. Coups d’état and prolonged periods of civil war heavily damaged infrastructure including government buildings, roads, bridges, ports, and railways, which are central to the development of the mineral sector. Since 2011, progress has been made in the rehabilitation of infrastructure in all three countries; however, much of it is still in need of repair. Poor infrastructure and inadequate electric power continue to be a major deterrent to foreign direct investment in mining (Pushak and Foster, 2011, p. 1–10; World Bank, 2013, p. 1–5; 2014).

Table 1 shows Guinea’s, Liberia’s, and Sierra Leone’s mineral production by commodity and each country’s mineral sector contribution to GDP and export earnings in 2012. Guinea was among the world’s leading producers of bauxite in 2012, accounting for about 6 percent of world bauxite output. The country was also a significant world producer of rough diamond. Production of bauxite was from the Friguia, Debele, and Sangaredi Mines (table 2, nos. 2–4).

Liberia produces cement, rough diamond, small amounts of gold, and iron ore. For many years, Liberia’s economy had relied heavily on production and exports of iron ore, which came to a halt in 1990 following the onset of civil war in Liberia. Diamond proceeds were used to a large extent to finance the civil war, which resulted in the United Nations Security Council imposing rough-diamond export sanctions on Liberia in 2001. Diamond sanctions were eventually lifted in April 2007 and production of iron ore resumed in 2011 (United Nations Security Council, 2007, p. 3, 7–8).

Sierra Leone produces cement, rough diamond, small amounts of gold, iron ore, and mineral sands (ilmenite and rutile). Bauxite and mineral sands production came to a standstill in 1994 owing to civil war in Sierra Leone. Because diamonds were also used to finance the civil war, diamond export sanctions were also imposed on the country. The civil war ended in 2002 and diamond sanctions were lifted in 2003. Production of bauxite from the Sierra Minerals Mine (table 2, no. 13) and mineral sands from the Sierra Rutile Mine (table 2, no. 18) resumed in 2006. Sierra Leone began producing iron ore again in 2011 with the reopening of the Marampa Mine (table 2, no. 16) and the opening of the Tonkolili Mine (table 2, no. 17). Sierra Leone’s production of rutile (94,493 metric tons [t]) accounted for more than 11 percent of world rutile output in 2012.

Figure 2 shows the mineral sector share of GDP for Guinea, Liberia, and Sierra Leone. Guinea’s mineral sector share of GDP fluctuated between 14 and 15 percent from 2004 to 2011 (fig. 2). The sector accounted for about 14 percent of the country’s GDP in 2012 and for about 90 percent of export earnings. Guinea’s sector share of GDP was estimated to have decreased to 12.5 percent in 2013 owing partly to a decrease in the production of alumina caused by the temporary closure of the country’s alumina plant as a result of a trade union strike.
In Liberia, prior to 1990, the contribution of the mineral sector to GDP stood at an average of about 25 percent, mostly driven by diamond and iron ore production. The contribution of Liberia’s mineral sector to GDP began to increase in 2007 as the embargo on diamond exports was lifted. Figure 2 shows the increase in the share of GDP accounted for by minerals, which was about 8 percent in 2012.

Sierra Leone’s mineral sector accounted for about 12 percent of GDP in 2012 and for about 70 percent of export earnings. Prior to the civil war, the sector’s share of GDP averaged about 15 percent, mostly driven by the production of bauxite, cement, diamond, and mineral sands. For 2013, the estimated contribution of the mineral sector to GDP in Guinea, Liberia, and Sierra Leone was about 13, 11, and 23 percent, respectively.

The Ebola Virus Disease Outbreak Crisis

The first laboratory-confirmed case of the EVD was reported by the Ministry of Health in Guinea on March 21, 2014. By early June, wide transmission of the EVD was confirmed in Liberia and Sierra Leone. The number of EVD cases peaked in late October and early November and by yearend had affected more than 20,000 people. As of January 18, 2015, the rate of infection had decreased significantly; however, transmission of the EVD continued in all three countries, with the total number of cumulative cases reported to be 21,797 (fig. 3) (Centers for Disease Control and Prevention, 2015a,b). Data reported by the Centers for Disease Control are based on World Health Organization (WHO) situation reports and correspond to the total number of reported suspected, probable, and confirmed cases of the Ebola virus disease for the period of March 23, 2014, to January 18, 2015.

Operating Status of Mines and Mineral Facilities

The names and locations of existing mining operations in Guinea, Liberia, and Sierra Leone and the names of major equity owners are listed in table 2. Most of the mining companies operating in these three countries reported that mining had continued mostly uninterrupted in 2014. Several mines were placed on care-and-maintenance status for reasons other than the EVD outbreak.

In Guinea, mining operations that continued mostly uninterrupted during 2014 included that of the Debele and Sangaredi bauxite mines (table 2, nos. 3, and 4); the Kiniero, Lefa, and Siguiiri gold mines (table 2, nos. 6, 7, and 8); and the Ciments de Guinée cement plant (table 2, no. 5). In Liberia, mining operations continued at the Bong and Western Range Project iron ore mines (table 2, nos. 11 and 12) and the Cemenco cement plant (table 2, no. 10). In Sierra Leone, the Sierra Minerals bauxite mine (table 2, no. 13) was active as of June 30. Mining companies reported anticipating a reduction in bauxite production owing to operational issues resulting not only from the EVD outbreak, but also from adverse weather conditions and social tensions in the country. The Sierra Rutile mineral sands mine (table 2, no. 18) continued to operate throughout the year although annual production was lower than expected, largely owing to challenges presented by the EVD outbreak (Sierra Rutile Ltd., 2015). Two workers from the Koidu Kimberlite Mine (table 2, no. 15), in the Kono District, contracted the EVD in early December. Two significant mine closures in Sierra Leone occurred during the year: that of the Marampa iron ore mine (table 2, no. 16) and the Tonkolili Mine (table 2, no. 17). The closure of these mines was related to the decrease in global iron ore prices and to issues related with offtake agreements and company debt (Armitage, 2014; Greve, 2015; Riseborough, 2014).

Status of Mineral Development Projects

Mineral development projects were the underpinnings for the World Bank’s forecasts of GDP increases in Guinea, Liberia, and Sierra Leone through 2017. In 2012, it was estimated that for Guinea the development of these projects had the potential to double the country’s real GDP by 2015 and to greatly enhance the prospects for future GDP growth through 2017 (World Bank, 2012, p. 2–3).

Figure 4 shows the total number of EVD cases as of yearend 2014 and the geographic location of mineral development and exploration projects. Liberia and Sierra Leone began to show significant signs of economic recovery in the mineral sector with the ramping up of existing mining operations and the resumption of iron ore mining in Liberia in 2010 and in Sierra Leone in 2011. The large number of companies prospecting and exploring for minerals, together with the increasing number of bauxite, diamond, gold, and, in particular, iron ore projects at an advanced stage of development, signaled prospects for continued growth. Many of those mineral projects had significant capital investments committed; total capital investments committed for the development of bauxite and alumina projects in Guinea alone were estimated to be in excess of $17 billion (Bates, 2012; Guinea Alumina Corp., 2014; Helmer, 2011; Lyall, 2015; Minesite, 2014; Torchia, 2014). Investments in associated infrastructure projects represented a significant portion of the cost. Capital expenditures committed for the development of iron ore resources in Guinea were estimated to be in excess of $10 billion (Bellzone Mining plc, 2013; BSG Resources Ltd., 2014; Rio Tinto SIMFER S.A., 2014; Sable Mining Africa, Ltd., 2015), a significant amount for a country whose GDP based on purchasing power parity (PPP) was estimated to be about $14 billion in 2012. In Liberia, the Putu Range iron ore project alone had committed capital expenditures of $3 to $4 billion (PAO Severstal, 2012). Liberia’s GDP based on PPP in 2012 was estimated to be about $3 billion. Committed capital expenditures in advanced development projects in Sierra Leone were about $200 million; the country’s GDP based on PPP was estimated to be about $10 billion in 2012 (Amara Mining plc, 2013; Stellar Diamonds plc, 2010, 2014).

Conclusions

Mineral production at the industrial scale was to a large extent maintained during 2014 (exceptions are noted in table 2). The activities of mining companies with projects under development or at an early exploration stage, with several exceptions, also continued mostly uninterrupted throughout the year. Quick, coordinated actions on the part of mining companies operating in all three countries helped surrounding communities and national health organizations in their effort to contain the virus. These efforts included (1) securing the perimeter of mining operations, (2) providing training to staff to ensure safety in and around mining facilities and adjacent communities, and (3) establishing health screening and preventative operating protocols to avoid the spread of the EVD. A group of mining companies created an advocacy group to coordinate efforts to address the EVD outbreak and, encouraged by the United Nations, pledged to continue to operate their businesses, to honor financial commitments, and to pay and train staff (ArcelorMittal, 2014b,c; United Nations Global Compact, 2015). Many mining companies also donated funds and medical equipment and...
supplies, among other essential items, to local governments and international organizations (United Company RUSAL plc, 2015b). The transportation of mineral goods to export points also functioned to a significant extent, although the outbreak caused delays in sea freight deliveries at some ports (Sierra Rutile Ltd., 2015). Some commercial flights to and from Guinea, Liberia, and Sierra Leone were cancelled and the limited availability of flights affected business travel for mining companies (Air France, 2014; British Airways, 2014; Emirates, 2014; International Civil Aviation Organization, 2014).

Uncertainty remains as to when, if at all, the Marampa and Tonkolili Mines will resume operation and whether individual iron ore development projects will proceed to production. The prospects for economic growth in Guinea, Liberia, and Sierra Leone hinge on the short-term development of these and other projects. The cancellation or significant delay of these projects would be a major setback for Guinea, Liberia, and Sierra Leone.

The USGS National Minerals Information Center (NMIC) collects, analyzes, and disseminates information on the international supply of and demand for minerals and mineral materials essential to the U.S. and world economies for more than 170 mineral producing countries around the world. Guinea, Liberia, and Sierra Leone are among the countries for which these types of data are collected and analyzed.
