FRANKLIN K. LANE, SECRETARY
U.S. GEOLOGICAL SURVEY
GEORGE OTIS SMITH, DIRECTOR

AREAL GEOLOGY

LEGEND

SEDIMENTARY ROCKS
(Areas of subaqueous deposits are shown by patterns of parallel lines, subaerial by dots and patterns of dots and circles)

Qal

Alluvium
(sand and loam, only the larger deposits shown, boundaries indicated by dashed lines)

Qf

Older terrace deposits
(gravel and loam)

Tc

Chadron formation
(coarse white sandstone and fine bedded sandstone, caps bedrock on surface of quadrangle)

Ti

Lance formation
(gray, light gray, and impure lignite)

Kfh

Fox Hills ?
sandstone
(gray sandstone in part indurated)

Kp

Pierre shale
(dark shale with gray intercalations and limestone lenses that form topsoil bottom of the northwesterly dips)

Kn

Niobrara formation
(limy shale and impure chalk; weathering light yellow)

Kcr

Carlile shale
(gray shale with many oval limestone concretions near top)

Kg

Greenhorn limestone
(impure, slabby buff limestone)

Kgs

Graneros shale
(dark gray fissile shale)

Economic data: Underground water is obtainable from the various oil and gas zones, as shown on the Artesian-water-map. Limestone concretions are used for lime or building stone. Much of the shale of the Niobrara formation has a massive structure of cement. Shales are suitable for tile manufacture. Gravel of terrace deposits is suitable for road surfacing.

Note: Section along line AA is shown in the text.

R.B. Marshall, Chief Geographer.
Sledge Tatnum, Geologist in charge.
Topographic by Glenn S. Smith, C.P. Gross,
and W.C. Colden, and from Vass sheet.
Irrigation ditches by U.S. Reclamation Service, 1913.
Control by A.F. Dunington, R.B. Robertson,
and H.M. Hadley.
Surveyed in 1904 and 1910.

APPROXIMATE MEAN DECLINATION 1910.
TRUE NORTH
MAGNETIC NORTH

Scale 1:250,000
Contour interval 50 feet.
Datum is mean sea level.
Edition of Jan. 1917.
