FLOODS ON MAHONING RIVER AT WARREN, OHIO, IN 1959

The approximate area flooded by the Mahoning River during the flood of January 30, 1959, is shown on the topographic map in Figure 1. A large amount of damage was caused by this flood. The flood levels were estimated to be as high as 6.5 feet above the flood stage of 1948, and are shown on the map. The flood duration was approximately 12 hours, and the maximum flood height was estimated to be 10 feet above the flood stage. The flood caused a significant amount of damage, including the destruction of bridges and roads. The flood also caused a large amount of debris to be washed into the river, which contributed to the flooding of the downstream area.

For additional information, please refer to the USGS report "Floods on the Mahoning River at Warren, Ohio, in 1959". This report provides a detailed description of the flood event, including the cause, duration, and impact. It also includes information on the floodplain and the river's characteristics.
