FLOODS ON SUSQUEHANNA RIVER AT ONEONTA, NEW YORK

This report was prepared by the U.S. Geological Survey to describe the flood of 1964 at Oneonta, which was caused by a combination of heavy rain and a downstream dam failure. The flood resulted in widespread damage and loss of life. The report includes information on the flood's characteristics, the effects on the community, and recommendations for future flood control measures.

The report uses maps and diagrams to illustrate the flood's impact and the surrounding area. The floodwaters spread across the landscape, flooding homes and businesses. The report also includes a timeline of events, showing the progression of the flood from its onset to its peak and subsequent drying out.

The report's conclusions highlight the importance of flood management and the need for better planning and infrastructure to prevent such disasters in the future.
