Introduction

The geologic map of the Kalispell 1° x 2° quadrangle (Harrison and others, 1992) was originally digitized by staff at the U.S. Geological Survey's Earth Resources Observation Systems (EROS) Data Center prior to 1994 and completed by U.S. Geological Survey staff and contractors at the Spokane Field Office (WA) in 2000 for input into a geographic information system (GIS). The resulting ArcInfo digital geologic map database can be queried in many ways to produce a variety of geologic maps. Digital base map data files (topography, roads, towns, rivers and lakes, etc.) are not included: they may be obtained from a variety of commercial and government sources. This database is not meant to be used or displayed at any scale larger than 1:250,000 (e.g., 1:100,000 or 1:24,000).

The map area is located primarily in northwest Montana (fig. 1). This open-file report describes the methods used to convert the geologic map data into a digital format, the ArcInfo GIS file structures and relationships, and explains how to download the digital files from the U.S. Geological Survey public access World Wide Web site on the Internet. Please refer to (Harrison and others, 1992) for unit descriptions and a discussion of the geology and structure.

We thank Gregory N. Green, U.S. Geological Survey, for performing a digital review of the dataset.

Data Sources, Processing, and Accuracy

Staff at the EROS Data Center digitized Harrison and others' (1992) geologic map of the Kalispell 1° x 2° quadrangle and minimally attributed the line and polygon features prior to 1994. This initial product was acquired by the Montana Bureau of Mines and Geology (MBMG). In 1999, the Spokane field office of the U.S. Geological Survey acquired the dataset from MBMG and augmented it with an interim geologic map data model (data base), further attributed and edited the dataset, and then plotted and compared the digital geologic map to the published paper geologic map (Harrison and others, 1992) to check for digitizing and attributing errors. All processing in Spokane was done in ArcInfo versions 7.2.1 and 8 installed on a Sun Ultra workstation.

The overall accuracy (with respect to the location of lines and points) of the digital geologic map (see figs. 2 and 3 for simplified versions) is probably no better than +/- 178 meters. This digital database is not meant to be used or displayed at any scale larger than 1:250,000 (e.g., 1:100,000 or 1:24,000).

Figure 1. Index map showing the geographic extent of the Kalispell quadrangle (black fill) with respect to the Pacific Northwest.

Figure 2. Explanation for the Simplified Digital Geologic Map of the KallsPELL 1:250,000 quadrangle.

Figure 3. Simplified Digital Geologic Map of the Kallspell 1:250,000 quadrangle.

GIS Documentation

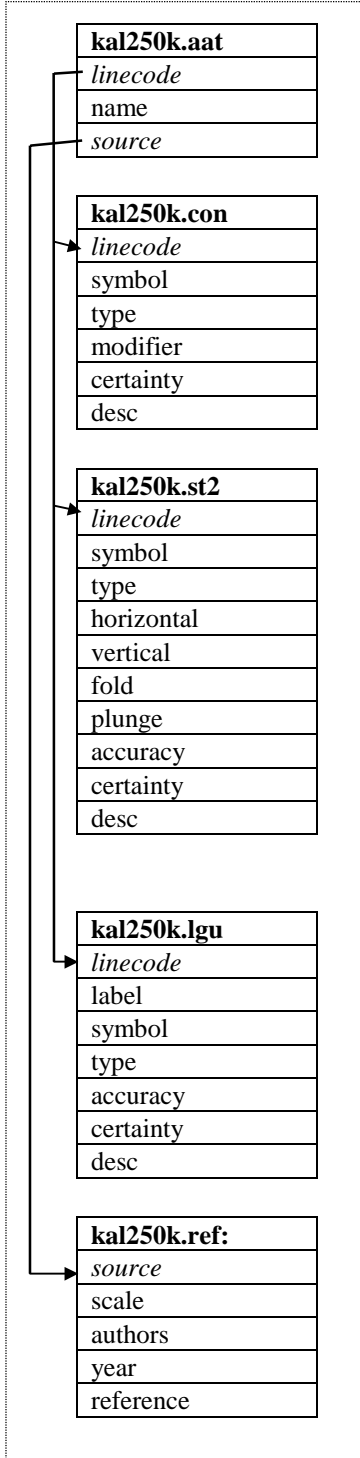

The digital geologic map of the Kalispell 1° x 2° quadrangle includes a geologic linework arc attribute table, KAL250K.AAT, that relates to the KAL250K.CON, KAL250K.ST2, KAL250K.LGU and KAL250K.REF files and a rock unit polygon attribute table, KAL250K.PAT, that relates to the KAL250K.RU and KAL250K.REF files (see fig. 4). These data files are described below.

Linear Features

Descriptions of the items identifying linear features such as contacts, boundaries (e.g., lines of latitude and longitude, state boundaries) and structures in the arc (or line) attribute table, KAL250K.AAT, are as follows:

KAL250K.AAT			
ITEM NAME	ITEM TYPE	ITEM LENGTH	ATTRIBUTE DESCRIPTION
linecode	integer	3	Numeric code used to identify type of linear feature. Linecodes < 100 are used for contacts and boundaries which are described in the KAL250K.CON file. Linecodes > 100 and < 600 represent structural features which are described in the KAL250K.ST2 file. Linecodes > 800 represent linear geologic units (e.g., dikes) which are described in the KAL250K.LGU file.
name	character	30	Name given to structural feature.
source	integer	4	Numeric code used to identify the data source for the linear feature. Complete references for the sources are listed in the KAL250K.REF file.

Arc attribute table and related look-up tables:

Polygon attribute table and related look-up tables:

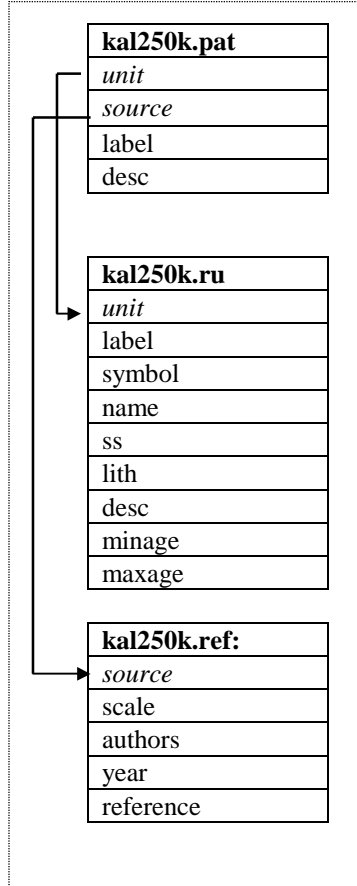

FIGURE 4: RELATIONSHIPS BETWEEN FEATURE ATTRIBUTE TABLES AND LOOK-UP TABLES.

Attribute descriptions for items in the contact (and boundary) look-table, KAL250K.CON [for use with the CARTO.LIN and GEOL_SFO.LIN linesets], are as follows:

KAL250K.CON			
ITEM NAME	ITEM TYPE	ITEM LENGTH	ATTRIBUTE DESCRIPTION
linecode	integer	3	Numeric code (a value < 100) used to identify type of contact or boundary. (This item also occurs in KAL250K.AAT.)
symbol	integer	3	Line symbol number used by ArcInfo to plot lines. Symbol numbers refer to the CARTO.LIN lineset for linecodes gt 40 and lt 100 and to the GEOL_SFO.LIN lineset for linecodes gt 0 and lt 40.
type	character	10	Major type of line, e.g., contact, state boundaries, lines of latitude and longitude used for neatlines.
modifier	character	20	Line type modifier, i.e., approximate, concealed, gradational. No entry implies 'known.'
certainty	character	15	Degree of certainty of contact or boundary, i.e., inferred, uncertain. No entry implies 'certain.'
desc	character	100	Written description or explanation of contact or boundary.

Attribute descriptions for items in the structure look-up table, KAL250K.ST2 [for use with the GEOL_SFO.LIN lineset] are as follows:

KAL250K.ST2			
ITEM NAME	ITEM TYPE	ITEM LENGTH	ATTRIBUTE DESCRIPTION
linecode	integer	3	Numeric code (a value > 100 and < 600) used to identify type of structural feature. (This item also occurs in KAL250K.AAT.)
symbol	integer	3	Line symbol number used by ArcInfo to plot arc (line). Symbol numbers refer to the GEOL_SFO.LIN lineset
type	character	10	Major type of structure, i.e., fault, fracture, fold, other.
horizontal	character	20	Type of horizontal fault movement, e.g., left-lateral, right-lateral. No entry implies 'unknown.'
vertical	character	20	Type of vertical fault movement, e.g., normal. No entry implies 'unknown.'
fold	character	15	Type of fold, e.g., anticline, syncline.
plunge	character	15	Type of plunge on fold, i.e., horizontal, plunging, plunging in, plunging out.
accuracy	character	15	Line type modifier indicating degree of accuracy, i.e., approximately located, concealed, gradational. No entry implies 'known.'
certainty	character	15	Degree of certainty of contact or boundary, i.e., inferred, uncertain. No entry implies 'certain.'
desc	character	100	Written description or explanation of structural feature.

Attribute descriptions for items in the linear geologic units (e.g., dikes and rock units that could only be mapped as linear features at a scale of 1:250,000) look-up table, KAL250K.LGU, for use with the GEOL_SFO.LIN lineset, are as follows:

KAL250K.LGU			
ITEM NAME	ITEM TYPE	ITEM LENGTH	ATTRIBUTE DESCRIPTION
linecode	integer	3	Numeric code (a value > 800) used to identify type of linear geologic unit. (This item also occurs in KAL250K.AAT.)
label	character	10	Map label used in the map proper to identify rock unit.
symbol	integer	3	Line symbol number used by ArcInfo to plot linear geologic unit. Symbol numbers refer to GEOL_SFO.LIN lineset .
type	character	10	Major type of linear geologic unit, e.g., dike, formation, sill.
accuracy	character	15	Line type modifier indicating degree of accuracy, i.e., approximate, concealed, gradational. No entry implies 'known.'
certainty	character	15	Degree of line type certainty, i.e., inferred, uncertain. No entry implies 'certain.'
desc	character	100	Written description or explanation of linear geologic unit.

Areal Features

Descriptions of the items identifying geologic units in the polygon attribute table, KAL250K.PAT, are as follows:

KAL250K.PAT			
ITEM NAME	ITEM TYPE	ITEM LENGTH	ATTRIBUTE DESCRIPTION
unit	integer	4	Numeric code used to identify the rock unit described in the KAL250K.RU look-up table. (This item also occurs in KAL250K.RU.)
source	integer	4	Numeric code used to identify the data source for the rock unit. Complete references for the sources are listed in the KAL250K.REF file.
label	character	10	Rock unit label (abbreviation) used to label unit on map.
desc	character	100	Written description or explanation of areal geologic unit.

Attribute descriptions for items in the lithology (rock unit) look-table, KAL250K.RU (for use with the CALCOMP1.SHD shadeset), are as follows:

KAL250K.RU			
ITEM NAME	ITEM TYPE	ITEM LENGTH	ATTRIBUTE DESCRIPTION
unit	integer	4	Numeric code used to identify rock unit. (This item also occurs in KAL250K.PAT.)
label	character	10	Rock unit label (abbreviation) used to label unit on map.
symbol	integer	3	Shadeset symbol number used by ArcInfo to plot a filled/shaded polygon. The symbol numbers used in this file refer to the CALCOMP1.SHD shadeset .
name	character	7	The prefix portion of the rock unit label that does not include subscripts. (If subscripting is not used in the original unit label, then the 'name' entry is the same as the 'label' entry.)
ss	character	3	The suffix portion of the geologic unit label that includes subscripts.
lith	character	20	Major type of lithologic unit, i.e., unconsolidated sediments, sedimentary rocks, metasedimentary rocks, intrusive rocks, extrusive rocks, metamorphic rocks, water, ice.
desc	character	100	Formal or informal unit name
minage	character	7	Minimum stratigraphic age of lithologic unit, i.e., CRET, TERT, PCY.
maxage	character	7	Maximum stratigraphic age of lithologic unit

Source Attributes

Descriptive source or reference information for the KAL250K ArcInfo coverage files is stored in the KAL250K.REF file. Attribute descriptions for items in the KAL250K.REF data source file is as follows:

KAL250K.REF			
ITEM NAME	ITEM TYPE	ITEM LENGTH	ATTRIBUTE DESCRIPTION
source	integer	4	Numeric code used to identify the data source. (This item also occurs in the KAL250K.AAT and KAL250K.PAT files.)
scale	integer	8	Scale of source map. (This value is the denominator of the proportional fraction that identifies the scale of the map that was digitized or scanned to produce the digital map.)
authors	character	200	Author(s) or compiler(s) of source map entered as last name, first name or initial, and middle initial.
year	integer	4	Source (map) publication date
reference	character	250	Remainder of reference in USGS reference format.

Obtaining Digital Data

The complete digital version of the geologic map is available in ArcInfo interchange-format (*.e00) with associated data files. These data and map images are maintained in a Transverse Mercator map projection:

Projection: TRANSVERSE
Units: METERS
Spheroid: CLARKE1866
Datum: NAD27
Parameters:
scale factor at central meridian: 1.00000000
longitude of central meridian -115 0 0.00
latitude of origin 0 0 0.000
false easting (meters) 0.00000
false northing (meters) 0.00000

To obtain copies of the digital data, do the following:

1. Download the digital files from the USGS public access World Wide Web site on the Internet: **URL = <http://pubs.usgs.gov/imap/i-2267/>**

The Internet sites contain the digital geologic map of the Kalispell 1:250,000 quadrangle both as an ArcInfo interchange-format file (kal250k.e00) and as a HPGL2 plot file (kal250k.hp) of the map area, as well as the associated data files and ArcInfo macro programs which are used to plot the map at a scale of 1:250,000.

To manipulate this data in a geographic information system (GIS), you must have a GIS that is capable of reading ArcInfo interchange-format files and that can perform relational linking.

Obtaining Paper Maps

Paper copies of the digital geologic map are not available from the USGS. However, with access to the Internet and access to a large-format color plotter that can interpret HPGL2 (Hewlett-Packard Graphics Language), a 1:250,000-scale paper copy of the map can be made, as follows:

1. Download the digital version of the map, **kal250k.hp**, from the USGS public access World Wide Web site on the Internet using the **URL = <http://pubs.usgs.gov/imap/i-2267/>**

2. This file can be plotted by any large-format color plotter that can interpret HPGL2. The finished plot is about 28 inches by 40 inches.

Paper copies of the map can also be created by obtaining the digital file as described above and then creating a plot file in ArcInfo with the provided AML.

Harrison, J.E., Cressman, E.R., and Whipple, J.W., 1992, Geologic and structure maps of the Kalispell 1° x 2° quadrangle, Montana, and Alberta and British Columbia: U.S. Geological Survey Miscellaneous Investigations Series Map I-2267, scale 1:250,000.

Appendix A - List of digital files in the Kalispell database (packaged as mi-2267.tar.Z)

- Uncompress the **mi-2267.tar.Z** file and extract the files from the resultant **mi-2267.tar** file.
- Run '**importfile.aml**' in ArcInfo to IMPORT all of the *.E00 files for use in ArcInfo.
- Use the ArcInfo 'DRAW' command to plot the *.GRA file to your screen. (Make sure the display is set with the ArcInfo 'DISPLAY' command.)
- Use the ArcInfo 'HPGL2' command to create a HPGL2 file from the *.GRA file.
- Use the UNIX 'lpr -P<plotter_name> kal250k.hp' command to send the kal250k.hp file to a large-format color plotter that can interpret Hewlett-Packard Graphics Language.
- To re-create the *.GRA file, open the ArcPlot module, enter 'display 1040', enter a new filename for the graphics file, enter '&run kal250k' (and enter 'quit' to exit the ArcPlot module). See the **00readme.txt** file for further file details.

Title:

Geologic and structure maps of the Kalispell 1:250,000
quadrangle, Montana, and Alberta and British Columbia: a
digital database.

Description:

Abstract:

This dataset was digitized by the U.S. Geological Survey EROS
Data Center and U.S. Geological Survey Spokane Field Office
for input into an Arc/Info geographic information system
(GIS). The digital geologic map database can be queried in
many ways to produce a variety of derivative geologic maps.

Purpose:

This dataset was developed to provide geologic map GIS of the Kalispell
1:250,000 quadrangle for use in the future spatial analysis by a
variety of users.

This database is not meant to be used or displayed at any scale larger
than 1:250,000 (e.g., 1:100,000 or 1:24,000).

Supplemental_Information:

This GIS dataset consists of one major Arc/Info dataset: a line and
polygon file (kal250k) that contains geologic contacts and structures
(lines) and geologic map rock units (polygons).

Use_Constraints:

This digital database is not meant to be used or displayed at any scale larger than 1:250,000 (e.g., 1:100,000 1:24,000).

Any hardcopies utilizing these data sets shall clearly indicate their source. If the user has modified the data in any way, they are obligated to describe the types of modifications they have performed on the hardcopy map. User specifically agrees not to misrepresent these data sets, nor to imply that changes they made were approved by the U.S. Geological Survey.

Data_Set_Credit:

Jack E. Harrison, Earle R. Cressman, James W. Whipple compiled the geology and published the original geologic paper map.

EROS Data Center staff scanned/digitized geologic map and prepared the original ArcInfo data prior to 1994.

Montana Bureau Mines and Geology acquired the original data and, in 1999, provided it to the USGS in Spokane, WA.

R.J. Miller (USGS) converted the original data to a single topologically correct ArcInfo coverage.

Helen Z. Kayser (contractor) attached and attributed an interim geologic map data model.

Thomas P. Frost (USGS), Pamela D. Derkey (USGS), and William N. Kelley (contractor) visually compared the hard copy plots with the source documents;

Native_Data_Set_Environment:

SunOS, 5.7, sun4u UNIX

ARC/INFO version 7.2.1

Data_Quality_Information:

Attribute_Accuracy:

Attribute_Accuracy_Report:

Attribute accuracy was verified by manual comparison of the source with hard copy printouts and plots.

Logical_Consistency_Report:

Polygon and chain-node topology present. Polygons intersecting the neatline are closed along the border. Segments making up the outer and inner boundaries of a polygon tie end to end to completely enclose the area. Line segments are a set of sequentially numbered coordinate pairs. No duplicate features exist nor do duplicate points in a data string. Intersecting lines are separated into individual line segments at the point of intersection. All nodes are represented by a single coordinate pair which indicates the beginning or end of a line segment.

Completeness_Report:

This digital geologic map is wholly derived from Harrison, and others (1992).

 Source_Contribution:

These two maps were the only maps used to create the digital geologic map database.

Process_Step:

Process_Description:

The published paper geologic map was digitized by the EROS Data Center prior to 1994.

Process_Step:

Process_Description:

The digital files were attributed by Helen Z. Kayser (contractor) at the USGS Spokane Field Office using an iterim geologic map data model. The data were checked for position by comparing plots of the digital data to the source.

Entity_and_Attribute_Information:

Overview_Description:

Entity_and_Attribute_Overview:

The 'Geologic map of the Kalispell 1- x 2-degree quadrangle, Montana ...' Miscellaneous Investigations Series Map I-2267 contains a detailed description of each attribute code. The database includes a geologic linework arc attribute table, kal250k.aat, that relates to the kal250k.con (contact look-up table), kal250k.st2 (structure look-up table), kal250k.lgu (linear geologic unit look-up table), and kal250k.ref (source reference look-up table) files; a rock unit polygon attribute table, kal250k.pat, that relates to the kal250k.ru (rock unit look-up table) and kal250k.ref (source reference look-up table) files.

Entity_and_Attribute_Detail_Citation:

See the kal250k.pdf file (available on the World Wide Web at <http://pubs.usgs.gov/imap/i2267/>) for detailed descriptions of items in the database.
