METALLIC MINERAL DEPOSITS OF SOUTH DAKOTA

By R. P. Fischer

Production data for the period 1881-1969 is compiled in the following section, which is based on Bureau of Mines data. The map of South Dakota is an outline map of the state. The legend is divided into four sections. The first section describes the general location of the mineral deposits. The second section indicates the type of deposit, based on the Bureau of Mines reports. The third section includes the estimated grade of the deposit, based on the Bureau of Mines reports. The fourth section indicates the number of years of production, based on the Bureau of Mines reports.

The Council on Geology in the United States is developing a report on the mineral production of the United States. The report will provide a comprehensive overview of the mineral production in the United States, including the mineral production of South Dakota. The report will be published in 1970.

HISTORY PRODUCTION AND OUTLOOK

South Dakota has a long history of mineral production, dating back to the early 1800s. The state was a major producer of gold, silver, and copper during the 19th century. However, the state's mineral production has declined significantly in recent years. The decline in mineral production is attributed to a number of factors, including the depletion of easy-to-recover deposits, increased production costs, and decreased demand for certain minerals.

The future of mineral production in South Dakota is uncertain. However, there are some indications that the state's mineral production may increase in the future. The state has a number of undeveloped mineral deposits, which could provide a source of future mineral production. In addition, the state has a number of mining companies that are actively exploring for new mineral deposits.
