EXPLANATION

Surface and direction of dip of beds and foliation

Springs and wells

Silver and gold deposits previously examined, possibly associated with tuff: 1. A 1.5-meter-wide semicircular ridge on the north margin of Black Range, sampled by a small drill core on the north margin of Black Range, sampled by a small drill core. 2. A 1.5-meter-wide semicircular ridge on the north margin of Black Range, sampled by a small drill core.

Biotite latite and biotite-quartz latite tuff, Medium gray; tuffaceous. Interbedded with Tertiary tuff and andesite tuff, with contacts that are not well-defined.

Silver and gold deposits previously examined: 1. A 1.5-meter-wide semicircular ridge on the north margin of Black Range, sampled by a small drill core. 2. A 1.5-meter-wide semicircular ridge on the north margin of Black Range, sampled by a small drill core.

Parts per million

Silver and gold deposits previously examined: 1. A 1.5-meter-wide semicircular ridge on the north margin of Black Range, sampled by a small drill core. 2. A 1.5-meter-wide semicircular ridge on the north margin of Black Range, sampled by a small drill core.

Histograms showing silver distribution

Parts per million

Silver and gold deposits previously examined: 1. A 1.5-meter-wide semicircular ridge on the north margin of Black Range, sampled by a small drill core. 2. A 1.5-meter-wide semicircular ridge on the north margin of Black Range, sampled by a small drill core.

Parts per million

Silver and gold deposits previously examined: 1. A 1.5-meter-wide semicircular ridge on the north margin of Black Range, sampled by a small drill core. 2. A 1.5-meter-wide semicircular ridge on the north margin of Black Range, sampled by a small drill core.
