MAP SHOWING UNCONSOLIDATED MATERIALS, WINDSOR LOCKS QUADRANGLE, CONNECTICUT

By
JANET RAYMOND WHITE

This map is designed to help identify the distribution of unconsolidated materials within the study area. The map is intended to assist in the planning and development of land use, including the identification of areas with potential economic deposits.

The map highlights the presence of unconsolidated materials within the study area. These materials include:

- Sedimentary materials
- Clayey materials
- Shale and mudstone
- Sand and gravel
- Alluvial deposits
- Tills and glacial deposits
- Loess

The map uses a variety of symbols to represent different types of unconsolidated materials, with varying degrees of density and concentration.

The map is intended for use by planners, developers, and engineers in determining the potential for economic deposits and for planning purposes.
