The Connecticut Valley Flood Area Project (CVAP) covers about 5,901,000 square miles from New Haven to New London, Conn., on Long Island Sound, to Boston, Mass., to Wiscasset, Maine. The project is to provide flood protection by flood control works, such as levees, embankments, and dikes, and by providing flood control structures, such as dams, dykes, and weirs, to reduce the risk of loss of life and property from floods. The project is to be financed by a combination of federal, state, and local funds, and is to be carried out by the Connecticut Valley Flood Control District, a public corporation established under the laws of Connecticut.

Regional and local planners and other decision makers responsible for land use and natural resource management, including land use, development, and conservation, should find these maps helpful in their planning and decision making. The maps can be used in various combinations, as in a series of overlays, according to the specific needs of a particular planning effort. The various layers of the map can be combined to provide a more comprehensive view of the land, showing the relationships between different types of land use and natural resources.

The purpose of the maps is to provide decision makers with a comprehensive view of the land, showing the relationships between different types of land use and natural resources. The maps can be used in various combinations, as in a series of overlays, according to the specific needs of a particular planning effort. The various layers of the map can be combined to provide a more comprehensive view of the land, showing the relationships between different types of land use and natural resources.
