DISTRIBUTION AND COST OF LANDSLIDES THAT HAVE DAMAGED MANMADE STRUCTURES DURING THE RAINY SEASON OF 1972-1973 IN THE SAN FRANCISCO BAY REGION, CALIFORNIA

by Fred A. Taylor, Tor H. Nilsen, and Robert M. Dean - 1975

Public costs are dollars spent or lost by agencies and individuals in the bay region. Private costs result from loss of real property and possessions, and any improvements that are required owing to the movement of slope-fanning materials. "Slpout" is included here as landslides. The landslides that are recorded ranged in size from a few tens to several thousands of square feet. They were recorded mostly in the San Francisco, San Mateo, Santa Clara, Solano, and Sonoma Counties. Landslide costs for these counties during the 1972-73 rainy season include costs of preparing and conducting court proceedings and only limited data are available on settlements of civil suits resulting from landslide damage.

The data used to compile these costs are incomplete, thus the total cost could be significantly greater. The landslides are defined as the downward and outward movement of slope-fanning materials, which may range in size from a few tens to several thousands of square feet. They were recorded mostly in the San Francisco, San Mateo, Santa Clara, Solano, and Sonoma Counties. Landslide costs for these counties during the 1972-73 rainy season include costs of preparing and conducting court proceedings and only limited data are available on settlements of civil suits resulting from landslide damage.
