The earthquake data shown on this map and listed in table 1 are a list of earthquakes that were originally used in preparing the seismicity of the United States (1965) which was published by the Department of the Interior, United States Geological Survey. The data were compiled in the early decades of the 20th century, and include information on the date, location, magnitude, and intensity of each earthquake. The data were compiled from various sources, including government reports, academic papers, and newspaper accounts. The information includes the date of the earthquake, the location of the epicenter, the magnitude, and the intensity. The intensity values were assigned based on the damage reported after the earthquake. The map shows the distribution of earthquakes across the United States, with a concentration in the western part of the country. The intensity values range from I to VI, with VI being the most severe. The map also includes a table with additional information on the earthquakes, including the epicentral coordinates and the magnitude. The data were compiled by the Geological Survey of the United States and are based on the historical record.
