INDEX MAP SHOWING MINES AND PROSPECTS MAPS (MF-SERIES MAPS AND OPEN-FILE REPORTS) IN THE BLACK HILLS REGION

EXPLANATION

Mine--Location known. Distinguished from prospect by name of mine next to symbol. Alternate names or synonym(s) in parentheses. If there is enough space on the map, the entire mine name and synonym(s) are shown; otherwise, mine name may be abbreviated and synonym(s) deleted from map. Full mine names and all synonyms

are shown in the "Alphabetic list of mines" Large pit OBA Gravel pit

Mine--Approximate location shown. Open pit, shaft, adit, or other type of opening

Multiple pits Patented claim -- See alphabetic and numeric lists of patented claims. Asterisk (*) indicates part of claim extends into adjacent quadrangle. Dollar sign (\$) indicates most of claim in adjacent quadrangle. Boundaries

between claims not shown Lode claim -- Orientation of number parallel to long axis of claim

INTRODUCTION

This map is one in a set of 26 maps (see index map) at 1:24,000 scale of the Black Hills region of South Dakota and Wyoming on which are shown a geologic classification of mines, a bibliography of mineral deposits, and locations of active and inactive mines, prospects, and patented mining claims. Some of these maps are published as U.S. Geological Survey Miscellaneous Field Studies Maps (MF series) and some as U.S. Geological Survey Open-File Reports (OF series); see index map. An earlier unpublished version of this set of maps was the data base from which plate 4 (scale 1:250,000) of DeWitt and others (1986) was compiled. Subsequent to that publication, the set has been revised and updated, and prospects and patented claims have been added. These revised and more detailed 1:24,000-scale maps should be used for the equivalent areas of plate 4 of DeWitt and others

SOURCES OF INFORMATION

Outlines of patented mining claims were obtained from

1:24,000-scale Forest Service Status Plats, available for inspection at the U.S. Forest Service, Rocky Mountains Region, 11,117 West 8th Avenue, Denver, CO 80225. Names of patented claims were obtained from the Crook County Courthouse, Sundance, Wyoming. Claims have been located as accurately as possible, but this map is not intended to be used for legal nor precise locations of mining claims. Locations of mines and prospects were compiled from all available published and unpublished data. The locations of active and inactive mines in this quadrangle were taken from Dunham (1946), Harris, Hausel, and Meyer (1985), Hausel and others (1979), Hill and Lindgren (1912), Osterwald and others (1966), Staatz (1983), U.S. Bureau of Mines (1986), U.S. Geological Survey (1986), and Wilmarth and Johnson (1953). Also, in some instances, different sources of information gave conflicting location information for mines with the same name. Where possible, this conflict was resolved by comparing the name of the mine to adjacent patented claims, by comparing the description of the deposit to the known geology and topography of the area, or by communication with past owners of the property. In some instances, a unique location could not be determined using existing information; in that event the most logical location was chosen. The location of some or many mines on this map may differ from those in present data bases such as the U.S. Bureau of Mines Mineral Inventory Location System (MILS) or the U.S. Geological Survey Mineral Resources Data System (MRDS), formerly the Computerized Resources Information Bank (CRIB).

Locations of prospects in this quadrangle were taken from Staatz (1983). Because many quadrangles, or parts of quadrangles, have not been mapped in as much detail as other quadrangles, comparison of the density of prospects from one quadrangle to another, or even within one quadrangle, should not be attempted. As an example, part of a quadrangle may be shown on the map as having more prospects than another part, but the first part may have been mapped in greater detail than the second part. Similarly, a part of a quadrangle may have many prospects that are not shown on this map because the original source of information did not Geologic data for the map are from Brown (1952),

Chenoweth (1955), Darton (1905, 1909), Darton and O'Harra (1905), DeWitt and others (1986), Dunham (1946), Fashbaugh (1979), Jenner (1984), Karner (1981), Lisenbee (1981, 1985), Love, Christiansen, and McGrew (1978), O'Toole (1981), Robinson, Mapel, and Bergendahl (1964), Staatz (1983), Staatz and others (1980), White (1980), and Wilkinson

PRECISION OF LOCATION INFORMATION

All mine symbols except the unfilled diamond (\lozenge) indicate that the location of the deposit is known within a 200-foot radius. The type of opening at a mine (adit, shaft, open pit, trench, and others) is designated by one of ten different symbols. The unfilled diamond symbol indicates that the location is known only to within a 1/4 mile radius and that the type of mine opening is unknown. Mines and prospects whose locations could not be verified to within closer than a 1/4 mile radius were not

PATENTED CLAIM AND MINE LISTS

Patented mining claims are listed both numerically and alphabetically. Mines are listed alphabetically. For ease in locating the claim or mine on the map, the legal description (section, township, range) is given. Each patented claim on the map is represented by a number keyed to the numeric and alphabetic listings. Where possible, the claim numbers are plotted approximately in the center of the claim and parallel to its long axis. Boundaries between adjacent claims are not shown. An asterisk (*) following a claim number indicates that most of the claim is in this quadrangle, but it extends into the adjacent quadrangle. A dollar sign (\$) following a claim number indicates that most of the claim is in the adjacent quadrangle, but part of it is in this quadrangle. Claims outlined with a solid line are patented lode claims; claims outlined with a dotted line are patented placer claims. Many placer workings on unpatented claims have not been plotted on the maps, principally because the workings lacked a name. On the map, the most common or most used name of a mine is normally next to its mine symbol. If there is space, any alternate names or synonyms are in parentheses following the most common name. On some maps, where space does not permit showing the first name or any alternate names, the names are shown by a single letter, two letters, or an abbreviation of the name; the mines are keyed to that letter or abbreviation in the alphabetic and numeric lists. Mines with more than one name have the alternate name(s) or synonym(s) shown in parentheses in the alphabetic lists. The first alternate name or synonym is also alphabetized in the alphabetic list of mines; second or third alternate names may not be alphabetized. Uncertain alternate names are not alphabetized and are followed by a query (?).

CLASSIFICATION OF MINES AND DEPOSITS

Mines and deposits are categorized according to geologic criteria of age, environment of formation, and contained metals, as in DeWitt and others (1986, p. 52-53). Deposit-type letter designations (M, W, and so on), corresponding to those in DeWitt and others (1986), are used in the alphabetic list of mines. The criteria used for the deposit types are briefly summarized below and are explained more fully in DeWitt and others (1986). PRINCIPAL TYPES OF DEPOSITS

M--Carboniferous or Permian high-calcium limestone is a bedded sedimentary deposit formed in a shallow water marine environment about 250-350 Ma. Precipitation of calcium carbonate from seawater and accumulation of organisms rich in calcium carbonate created the deposits. W, X, and Y--Paleocene or Eocene disseminated and

carbonatite deposits are fracture-filling, vein, and disseminated concentrations of base, precious, and rareearth-element metals formed in a plutonic to subvolcanic environment about 50-60 Ma. Fracturing and metasomatic alteration of Tertiary alkalic igneous complexes and associated carbonatites resulted in precipitation of sulfide and carbonate minerals. W, thorium-rich deposits containing thorium and manganese and minor amounts of uranium. X, rare-earth-element-rich deposits containing lanthanum, cerium, other rare light-rareearth elements, lead, barium, strontium, and minor amounts of thorium and uranium. Y, precious metal-rich deposits containing gold, tellurium, and minor amounts of silver.

-- Coal deposits in the Lower Cretaceous Inyan Kara Group are stratabound accumulations of organic remains that formed in a fresh-water environment about 100-150 Ma. Organic substances, mostly plant remains, were modified into subbituminous coal and carbon-rich sedimentary

ACKNOWLEDGMENTS

J. J. Norton, J. A. Redden, J. P. Gries, and W. L. Roberts reviewed the set of maps. Rob Yambrick helped digitize much of the information.
