## 2019 Minerals Yearbook

## LIME [ADVANCE RELEASE]

## Lime

## By Lori E. Apodaca

## Domestic survey data and tables were prepared by Joshua A. Braunstein, statistical assistant.

In 2019, lime production in the United States (including Puerto Rico) was 16.9 million metric tons ( Mt ) and had a value of $\$ 2.32$ billion (table 1). The production quantity decreased by $6 \%$ and the value decreased by $4 \%$ compared with that in 2018. Lime consumption decreased in most major market sectors: chemical, flue gas treatment, industrial, metallurgy, refractory, and sludge treatment. Increases were recorded for sales in construction and water treatment (table 3). On average, prices for lime sold or used were higher in 2019 than in 2018 (table 5).

Lime plants and facilities require close proximity to markets and access to suitable transportation networks to allow for costeffective production and distribution. The U.S. lime industry is dominated by a few large-scale producers with nationwide supply and distribution networks. Because there is a scarcity of high-quality limestone deposits for which required zoning and mining permits can be obtained, production capacity increases usually are met by replacing older kilns at existing plants thereby using existing air quality permits for new, more efficient, and higher capacity kilns that have reduced emissions.

Lime, as quicklime, is a basic chemical produced in 28 States and Puerto Rico. The U.S. lime industry consisted of 28 companies in 2019. Of these, 15 companies produced lime products for sale, 10 produced lime that was used entirely for internal company purposes, and 3 did both. Owing to its chemical reactivity and short shelf life, lime is not stockpiled in large amounts. Consequently, data on stocks are not collected. Thus, on an annual basis, lime "sold or used" is considered to be equivalent to both production and consumption. In 2019, Alabama and Missouri were the only two States that had production in excess of 2 Mt ; three States (Kentucky, Ohio, and Texas) produced between 1 and 2 Mt .

The term "lime," as used throughout this report, refers primarily to six chemicals produced by the calcination of high-purity limestone (calcium carbonate, $\mathrm{CaCO}_{3}$ ) or dolomite $\left[\mathrm{CaMg}\left(\mathrm{CO}_{3}\right)_{2}\right]$, followed by hydration when necessary. The two high-calcium forms of lime are high-calcium quicklime (calcium oxide, CaO ) and high-calcium hydrated lime [calcium hydroxide, $\mathrm{Ca}(\mathrm{OH})_{2}$ ]. The four calcium-magnesium (dolomitic) forms are dolomitic quicklime $(\mathrm{CaO} \cdot \mathrm{MgO})$, dolomitic hydrate type $\mathrm{N}\left[\mathrm{Ca}(\mathrm{OH})_{2} \cdot \mathrm{MgO}\right]$, dolomitic hydrate type $\mathrm{S}\left[\mathrm{Ca}(\mathrm{OH})_{2} \cdot \mathrm{Mg}(\mathrm{OH})_{2}\right]$, and refractory dead-burned dolomite $(\mathrm{CaO} \cdot \mathrm{MgO})$. The terms "type N" and "type S " refer to "Normal hydrated lime" and "Special hydrated lime" that are differentiated primarily by the compounds' plasticity (ability to retain water) and oxide content. Air-entrained versions of these hydrates are designated as "type NA" and "type SA."

In 2019, all commercially produced lime in the United States was manufactured from limestone or dolomite. Lime also can be produced from a variety of similar carbonate materials, such as aragonite, chalk, coral, marble, and seashells, if they are of high chemical purity. Lime also is regenerated and produced as a
byproduct by carbide plants, paper mills, sugar mills, and watertreatment plants. Regenerated lime, however, is not covered in this report.

In the United States, most lime (about $83 \%$ ) is produced as quicklime (table 1). Hydrated lime (also called slaked lime) is a dry calcium hydroxide powder made from reacting quicklime with a controlled amount of water in a hydrator. Hydrated lime also includes dispersions (suspensions) of calcium hydroxide particles in water, either in the form of milk of lime or lime putty. Milks of lime contain up to $40 \%$ by weight of solids, and lime putties contain $55 \%$ to $70 \%$ of solids. Hydrated lime is used widely in aqueous systems as a low-cost alkali to neutralize or balance acidity (Oates, 1998, p. 1, 229).

## Production

Domestic production data for lime were derived by the U.S. Geological Survey (USGS) from a voluntary canvass of U.S. operations. The canvass included primary producers of quicklime and hydrate. To avoid double counting, the canvass did not include independent hydrators that purchase quicklime for hydration. Quantity data were collected for 28 specific and general end uses, and value data were collected by type of lime. Of the 92 operations that were canvassed in 2019, 80 operations responded, 2 of which were idle during the entire year. Data received represented $88 \%$ of the total lime sold or used by producers listed in tables 1 through 5. Production data for the nonrespondents were estimated based on prior-year production data and other information.

In 2019, quicklime was produced at 74 lime plants, including 30 plants with colocated hydrating plants. Hydrated lime also was produced at 14 stand-alone hydrating facilities. These numbers do not necessarily agree with the number of plants reported in table 1 because, for data collection purposes, some company operations were combined at the respondent's request. In some States that had no quicklime production, hydrating plants used quicklime sourced from other States. There were also stationary lime slurry plants in some States where hydrated lime was converted (slaked) to form lime slurry (milk of lime) by the addition of water prior to sale. Mobile hot lime slurry production systems also were used to slake quicklime or to make a hydrated lime slurry to the percentage of solids (milks of lime or lime putties) required for specific jobs.

Data on lime sold or used in the United States were reported by U.S. Census Bureau regions (table 2). In 2019, production (or the total amount of lime sold or used by domestic producers) including Puerto Rico, was 16.9 Mt , a $6 \%$ decrease compared with that in 2018 (table 2). The Midwest and East South Central regions, combined, accounted for $59 \%$ of total production, compared with $63 \%$ in 2018 (table 2). The totals included the commercial sale or captive consumption by producers
(described by the term "used") of quicklime, hydrated lime, and dead-burned refractory dolomite. Data on the production of hydrated lime were incomplete because some producers did not report data on downstream hydrating plants.

Most U.S. lime production sold or used was in the form of high-calcium quicklime. In 2019, production of highcalcium quicklime decreased by $8 \%$ to 11.3 Mt and dolomitic quicklime production decreased by $4 \%$ to 2.7 Mt from that in 2018 (table 1). The production of high-calcium hydrate was essentially unchanged from that in 2018, and dolomitic hydrate production increased slightly from that in 2018. Commercial sales of quicklime and hydrate decreased by $7 \%$ to 15.7 Mt and lime produced for captive consumption decreased by $3 \%$ to 1.18 Mt , compared with that in 2018.

At yearend, the top 10 U.S. lime-producing companies, in descending order of production, were Lhoist North America; Graymont Ltd.; Carmeuse Americas; Mississippi Lime Co.; Martin Marietta Magnesia Specialties, LLC; United States Lime \& Minerals, Inc.; Pete Lien \& Sons, Inc.; Cheney Lime \& Cement Co.; Greer Lime Co; and Linwood Mining and Minerals Corp. These companies reported production from 45 lime plants and 10 stand-alone hydrating plants and accounted for $99 \%$ of the combined commercial lime sales and $91 \%$ of total lime production.
On August 1, Mississippi Lime completed its acquisition of the Calera, AL, lime facility, which was previously operated by Southern Lime Corp. The Calera facility increased Mississippi Lime's production facilities to nine locations, supported by a network of distribution sites throughout the United States (Mississippi Lime Co., 2019).

On October 10, Graymont announced plans to build a production facility adjacent to its limestone deposit in Rexton, MI. The facility would produce a variety of lime and limestone products. The production facility was expected to be operational by the end of 2020 , contingent on receiving required regulatory approvals (Graymont Ltd., 2019).

## Consumption

In 2019, reported U.S. lime consumption decreased in most major market sectors (table 3). The percentage distribution of lime consumption by general end-use sector changed little from that in 2018 and was $36 \%$ for metallurgical uses, $26 \%$ for environmental uses, $21 \%$ for chemical and industrial uses, $12 \%$ for construction uses, $4 \%$ for miscellaneous uses, and $1 \%$ for refractories. These end-use data were based on lime sold or used by domestic producers and did not include lime imports.
Commercial sales (lime sold by producers) accounted for $93 \%$ of total U.S. lime consumption (table 1). Captive lime (lime that was used by companies for internal purposes) accounted for the remainder of consumption and was used in the production of steel in basic oxygen furnaces (BOFs), magnesia production, precipitated calcium carbonate production, refractories (deadburned dolomite), sugar refining, and wastewater. As a result, table 3 lists only the total quantity (commercial plus captive) by end use. Additional end uses with captive consumption are listed in footnote 5 of table 3.
In steel production, quicklime was used as a flux and slagging agent in BOFs and electric arc furnaces (EAFs) to remove
impurities, such as phosphorus, silica, and sulfur, from the hot metal. The steel industry accounted for $29 \%$ of lime sold or used by domestic lime producers. According to the World Steel Association (2020, p. 1), U.S. steel production in 2019 increased slightly from that in 2018; lime sold for total steel and iron uses in 2019 was $5 \%$ less than that in 2018 (table 3).
In nonferrous metallurgy, lime was used in the beneficiation of copper and zinc ores to neutralize the acidic effects of pyrite and other sulfides and to maintain the proper pH in the flotation circuits. It also was used to prevent pyrite from entering the copper or zinc concentrate. Lime was used to process alumina and magnesia, extract uranium from gold slimes, and recover nickel by precipitation.
Gold and silver were recovered using heap leaching and by conventional milling and subsequent leaching of the slurry. Heap leaching involved crushing ore, mixing with lime or portland cement for pH control and sometimes agglomeration, then stacking the ore in heaps on specially prepared pads for treatment with cyanide or thiourea solution. Lime was used to maintain the cyanide or thiourea solution at a pH level between 10 and 11 to maximize the recovery of precious metals and to prevent the creation of hydrogen cyanide gas.

Lime consumption data for nonferrous metallurgical uses [alumina and bauxite processing, flotation processing of sulfide ores (principally copper and gold ores), and unspecified nonferrous uses] are combined to avoid disclosing company proprietary data and are reported in table 3 under "Metallurgical: Nonferrous metallurgy." In 2019, lime consumption in nonferrous metallurgy increased by $5 \%$ to 1.18 Mt (table 3 ) but was lower than the peak of 1.33 Mt in 2015.
Lime was used in numerous processes to treat discharges to the environment in active and abandoned mines. These processes included the treatment of acid-mine drainage from operating and abandoned mines, specialized treatment processes such as catalyzed cementation of arsenic and other heavy metals, and treatment of precious metals mine tailings to recover cyanides.

Lime was used, generally in conjunction with soda ash $\left(\mathrm{Na}_{2} \mathrm{CO}_{3}\right)$, for softening municipal and plant process water. This precipitation process removes soluble calcium and magnesium cations, and to a lesser extent, ferrous iron, manganese, strontium, and zinc cations that contribute to the hardness of water. This process also reduces carbonate alkalinity and total dissolved solids. Lime consumption for drinking water treatment increased by $3 \%$ in 2019 compared with that in 2018 (table 3).

In sewage treatment, the traditional role of lime was to control pH in the sludge digester, where it removed dissolved and suspended solids containing phosphates and nitrogen compounds. Lime aided in clarifying wastewater and destroying harmful bacteria and was used to stabilize the resulting sewage sludge for beneficial use or disposal. Sewage sludge stabilization, also called biosolids stabilization, reduces odors, pathogens, and putrescibility of the solids. Lime stabilization involves mixing quicklime with the sludge to raise the temperature and pH of the sludge to minimum levels for a specified period of time, depending on the biosolids classification. The National Lime Association (undated) has a concise description of lime's use in biosolids stabilization. In

2019, lime consumption for all sludge treatment decreased by $4 \%$ compared with that in 2018 (table 3).

In flue gas treatment (FGT) systems serving coal-fired powerplants, incinerators (most were waste-to-energy powerplants), and other industrial plants, lime was injected into the flue gas to remove gaseous pollutants, particularly sulfur dioxide $\left(\mathrm{SO}_{2}\right)$ and hydrochloric acid ( HCl ). Many FGT systems at utility powerplants were designed to produce byproduct synthetic gypsum $\left(\mathrm{CaSO}_{4} \cdot 2 \mathrm{H}_{2} \mathrm{O}\right)$ from the captured $\mathrm{SO}_{2}$. In 2019, 20.8 Mt of synthetic gypsum was produced from FGT by utility powerplants (American Coal Ash Association, 2020), although only 12.1 Mt was used. This gypsum is suitable for use in manufacturing wallboard, as an additive in portland cement, and as a soil amendment in agriculture. Hydrated lime was used in another FGT-related market-to control sulfur trioxide $\left(\mathrm{SO}_{3}\right)$ emissions from selective catalytic reduction systems installed at powerplants to control emissions of nitrogen oxides $\left(\mathrm{NO}_{\mathrm{x}}\right)$. Utility powerplants were by far the leading consumers of lime for FGT and accounted for $85 \%$ of the total FGT lime market in 2019 (table 3). Incinerators, industrial boilers, and other FGT uses accounted for the remainder. In 2019, lime consumption decreased by $29 \%$ in the utility powerplant market and decreased by $3 \%$ in the incinerators market and the industrial boilers and other FGT markets, combined (table 3). The use of hydrated lime in FGT in 2019 decreased by $8 \%$ to 494,000 t (table 4).

Hydrated lime was used by the pulp and paper industry in the basic kraft pulping process for converting wood chips into wood pulp. Hydrated lime sometimes was used to produce calcium hypochlorite bleach for bleaching the paper pulp. The paper industry also used lime as a coagulant aid in the clarification of plant process water. In 2019, consumption of lime for pulp and paper production increased slightly from that in 2018 (table 3).

Lime was used to make precipitated calcium carbonate (PCC) for use as a specialty filler in premium-quality coated and uncoated papers, paints, and plastics. The most common method of making PCC in the United States was the carbonation process. Carbon dioxide $\left(\mathrm{CO}_{2}\right)$ is bubbled through calcium hydroxide (as milk of lime) to form a precipitate of calcium carbonate and water. The reaction conditions determine the size and shape of the resulting PCC crystals. Lime used for PCC production decreased by $11 \%$ compared with that in 2018 (table 3 ).

The chemical industry also used lime in the manufacture of alkalis. Other chemical uses included the production of calcium carbide, which is formed when quicklime is combined with coke; calcium carbide, in turn, was used to make acetylene and calcium cyanamide. Lime also was used to make calcium hypochlorite bleaches, citric acid, petrochemicals, and many other chemicals.

In sugar refining, milk of lime was used to raise the pH of the product stream, precipitating out colloidal impurities. The lime itself was then removed by reaction with $\mathrm{CO}_{2}$ to precipitate calcium carbonate.

Hydrated lime was used in oil and gas drilling as a source of alkalinity and calcium in oil- and water-base drilling fluids. Drilling fluid applications included increasing the pH , providing excess lime as an alkalinity buffer, flocculating bentonite drilling muds, removing soluble carbonate $\left(\mathrm{CO}_{3}{ }^{2-}\right)$ ions, controlling
corrosion, and activating fatty-acid oil-base mud additives (M-I SWACO, 2011).

In the construction sector, hydrated lime was used in hot mix asphalt as an antistripping agent. Stripping is generally defined as a loss of adhesion between the aggregate surface and the asphalt binder in the presence of water. Lime also was used in cold, in-place recycling for the rehabilitation of distressed asphaltic pavements. Existing asphaltic pavement is pulverized using a milling machine and a hot lime slurry is added along with asphalt emulsion. The cold recycled mix is placed and compacted by conventional paving equipment, which produces a smooth base course for the new asphaltic surface. In 2019, sales of lime for use in asphalt decreased by $24 \%$ compared with those in 2018 (table 3).

Hydrated lime and quicklime also were used to stabilize fine-grained soils, such as hydraulic clay fills or otherwise poor-quality clay and silty materials obtained from cuts or borrow pits, in place of materials that were employed as subbases. Lime also was used in base stabilization, which included upgrading the strength and consistency properties of aggregates that may be judged unusable or marginal without stabilization. Common applications for lime stabilization included the construction of airfields, building foundations, earthen dams, parking areas, and roads.

Lime sales for soil stabilization have tended to be cyclical, especially in major market areas such as Texas. In the soil stabilization market, lime competed with portland cement, cement kiln dust, fly ash, and other additives (liquid enzymes, for example). The choice of material for soil stabilization depended on availability, price, contract specifications, soil chemistry, and State and Federal funding in the case of highway construction projects. The amount of lime consumed for soil stabilization in 2019 increased by $14 \%$ compared with that in 2018 (table 3). According to the U.S. Census Bureau (2020, table 2), public spending on highway and street construction was $\$ 98.8$ billion in 2019, an increase of $9 \%$ from the $\$ 90.8$ billion spent in 2018.

Hydrated lime was used in the building sector for some mortars, plasters, and stuccos. Standard masonry cement mortars that include lime exhibit superior workability balanced with appropriate compressive strength, as well as low water permeability and superior bond strength. Lime was a major constituent in some exterior and interior plasters and stuccos, enhancing the durability, strength, and workability of these finishes. A small amount of hydrated lime also was used in the renovation of old structures built with lime mortars, which were commonplace before the development of portland cement mortars. Modern portland cement-base mortars are incompatible with old lime mortars. Hydrated lime also was used to make synthetic hydraulic lime, which is produced by blending powdered hydrated lime with pulverized pozzolanic or hydraulic materials.

Almost all lime sold or used in 2019 for building use was in the form of hydrate [248,000 $t$ (table 4) out of $251,000 t$ of total lime (table 3)]. In 2019, the total quantity of lime consumed in building uses, such as in aerated concrete, mortar, plaster, and whitewash, decreased slightly compared with that in 2018 (table 3).

Dead-burned dolomite, also called refractory lime, was used as a component in tar-bonded refractory brick or monolithics manufactured for use in BOFs. Refractory brick also was used in the lining of many treatment and casting ladles, in cement clinker kilns, in argon-oxygen decarburization and vacuumoxygen decarburization converters, in EAFs, and in continuous steel casting. The data on dead-burned dolomite reported in table 3 were rounded to one significant digit to avoid disclosing company proprietary data; unrounded data show that the consumption of dead-burned dolomite in 2019 was $3 \%$ less than that in 2018. Magnesita Refractories Co. at its York, PA, plant and Carmeuse at its Millersville, OH , plant were the only significant domestic producers of dead-burned dolomite. Although dead-burned dolomite was the primary form of lime used in refractories, hydrated lime may be used to produce silica refractory brick used to line industrial furnaces.

## Prices

The USGS calculates unit values of lime products from the quantity and value data reported for lime sold or used by the lime producers on a free-on-board plant basis, including the cost of containers. These provide average values that eliminate variables such as potentially significant differences between list prices and individual supply contracts. Lime prices were not published in trade publications, so the data listed in table 5 have historically been used as representative of U.S. lime prices. To avoid disclosing company proprietary data, value data for dead-burned dolomite were not reported separately but were included within the weighted average of all types of lime. The total weighted average price per metric ton of all quicklime and hydrate sold or used in 2019 increased slightly. Annual average prices in 2019 for high-calcium quicklime sold and highcalcium hydrate sold increased by $4 \%$ and increased slightly, by $\$ 4.50$ and $\$ 2.50$ per metric ton, respectively, compared with those in 2018. Annual average prices for dolomitic quicklime sold decreased by $\$ 2.80$ per metric ton and that of dolomitic hydrate sold increased by $\$ 5.00$ per metric ton. During the prior 10 years, the total annual weighted average price for all types of lime increased by $\$ 33.80$ per metric ton.

## Foreign Trade

The United States exported and imported calcined dolomite (dolomitic lime), hydrated lime (slaked lime), hydraulic lime, and quicklime. Total exports and imports of lime were very small-each about $2 \%$-compared with the total quantity produced domestically in 2019. Total exports of lime in 2019 were 347,000 metric tons ( t ) valued at $\$ 63.5$ million (table 6). About $97 \%$ of exports went to Canada and $3 \%$ to other countries. Total imports of lime were $342,000 \mathrm{t}$ valued at $\$ 62.4$ million; about $89 \%$ were from Canada, $8 \%$ from Mexico, and 3\% from other countries (table 7). Canada provided nearly all the high-calcium quicklime and dolomitic (calcined dolomite) lime and $57 \%$ of slaked lime imports.

No tariffs were placed on imports of hydraulic lime, quicklime, and slaked lime from countries with normal trade relations (NTR) with the United States. A 3\% ad valorem tariff was placed on imports of calcined dolomite from NTR countries.

## World Review

In 2019, global lime production was 430 Mt , slightly higher than that in 2018 but an average of $8 \%$ higher than global production in 2015-17 (table 8). The leading lime-producing countries in 2019 were China (72\%), India and the United States ( $4 \%$ each), Russia ( $3 \%$ ), and Brazil, Germany, and Japan ( $2 \%$ each). Lime was mostly traded on a regional basis because it was a low-value, bulk, and reactive product that could not be shipped long distances and compete with lime produced locally. Most countries have limestone or dolomite deposits, which allowed for at least some local production and consumption. There may also have been some trade between countries on a regional basis where distances are not great, such as within the European Union, or to supply lime products of a quality not locally available.

Except for some industrialized nations, accurate lime production data for individual countries are difficult to obtain and are commonly incomplete. In addition to production by large commercial lime companies, lime was produced by small-scale manufacturers operating simple kilns to supply local consumers and by industries producing lime for internal consumption. Also, crushed limestone production data often are reported as lime data. In some cases, lime sales data have been used as a proxy for country production figures.

## Outlook

Lime sales in markets such as chemical and industrial, construction, and steel are expected to follow trends in the gross domestic product of the overall economy. The outlook for FGT (lime's second-leading market) is easier to predict. With the recent boom in natural gas exploration, large increases in natural gas reserves, and low natural gas prices, U.S. electric utilities have increasingly shifted their fuel use from coal to natural gas. Natural gas has the advantage of producing lower levels of emissions than coal and, as a result, natural-gas-fired powerplants usually do not require $\mathrm{SO}_{2}$ scrubbing, leading to decreased FGT lime consumption. This trend is likely to continue. The U.S. Energy Information Administration (2020, p. 4) reported that total domestic utility-scale electricity generation in 2019 was $37 \%$ from natural gas, $24 \%$ from coal, and $39 \%$ from other sources (hydropower, nuclear, and renewables). For 2020, the forecast is for $39 \%$ of the electricity to come from natural gas and 20\% from coal. In 2021, natural gas and coal were forecast to generate $34 \%$ and $24 \%$ of electricity, respectively. Coal use to generate electricity in 2021 was expected to increase as a result of higher natural gas prices.

| Miscellaneous and unspecified | 613 | 653 |
| Grand total | 18,000 ${ }^{\text {r }}$ | 16,900 |

${ }^{\mathrm{r}}$ Revised. W Withheld to avoid disclosing company proprietary data; included with "Miscellaneous and unspecified."
${ }^{1}$ Table includes data available through December 15, 2020. Data are rounded to no more than three significant digits; may not add to totals shown. Excludes lime kiln dust and regenerated lime.
${ }^{2}$ Includes Puerto Rico.
${ }^{3}$ Includes lime sold and used, where "used" denotes lime produced for internal company use.
${ }^{4}$ May include alkalis, calcium carbide and cyanamide, calcium hypochlorite, citric acid, food (animal or human), oil and grease, oil well drilling, petrochemicals, tanning, and other uses. Magnesia is included here to avoid disclosing proprietary data.
${ }^{5}$ Includes alumina and bauxite, magnesium, metals concentration (copper and gold), and other nonferrous uses.
${ }^{6}$ Data are rounded to no more than one significant digit to avoid disclosing company proprietary data.

TABLE 4
HYDRATED LIME SOLD OR USED IN THE UNITED STATES, BY END USE ${ }^{1,2,3}$

| (Thousand metric tons) |  |  |
| :---: | :---: | :---: |
| Use | 2018 | 2019 |
| Chemical and industrial | $542{ }^{\text {r }}$ | 615 |
| Construction: |  |  |
| Asphalt | 218 | 149 |
| Building uses | $252{ }^{\text {r }}$ | 248 |
| Soil stabilization | W | W |
| Other construction | 541 | 618 |
| Total | 1,010 | 1,020 |
| Environmental: |  |  |
| Flue gas treatment: |  |  |
| Utility powerplants | 411 | 361 |
| Incinerators | 25 | 22 |
| Industrial boilers and other flue gas treatment | 103 | 111 |
| Total | 539 | 494 |
| Sludge treatment: |  |  |
| Sewage | 42 | 29 |
| Other sludge treatment | 90 | 91 |
| Total | 132 | 120 |
| Water treatment: |  |  |
| Acid-mine drainage | 56 | 41 |
| Drinking water | 111 | 123 |
| Wastewater | 125 | 138 |
| Total | 292 | 301 |
| Other environmental | 88 | 63 |
| Metallurgy | 87 | 89 |
| Grand total | 2,690 | 2,700 |

${ }^{\mathrm{r}}$ Revised. W Withheld to avoid disclosing company proprietary data; included with "Other construction."
${ }^{1}$ Table includes data available through December 15, 2020. Data are rounded to no more than three significant digits; may not add to totals shown. Excludes regenerated lime. ${ }^{2}$ Includes Puerto Rico.
${ }^{3}$ Includes hydrated lime sold and used, where "used" denotes lime produced for internal company use in the building, chemical and industrial, and metallurgical sectors.

TABLE 5
LIME PRICES IN THE UNITED STATES, BY TYPE ${ }^{1,2,3}$

| Type | 2018 |  | 2019 |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Dollars per metric ton | Dollars per short ton | Dollars per metric ton | Dollars per short ton |
| Sold or used: |  |  |  |  |

QUICKLIME AND HYDRATED LIME, INCLUDING DEAD-BURNED DOLOMITE: WORLD PRODUCTION, BY COUNTRY OR LOCALITY ${ }^{1}$

[^0]
[^0]:    ${ }^{\mathrm{e}}$ Estimated. ${ }^{\mathrm{r}}$ Revised.
    ${ }^{1}$ Table includes data available through December 22, 2020. All data are reported unless otherwise noted. Totals and estimated data are rounded to no more than two significant digits; may not add to totals shown.
    ${ }^{2}$ In addition to the countries and (or) localities listed, Argentina, Chad, Iraq, Lebanon, Mexico, Nigeria, North Korea, Pakistan, Saudi Arabia, Syria, and several other countries may have produced lime, but available information was inadequate to make reliable estimates of output.
    ${ }^{3}$ Includes hydraulic lime.
    ${ }^{4}$ Includes Afghanistan, Albania, Algeria (hydraulic), Armenia, Azerbaijan (construction), Cameroon, Cuba, Cyprus (hydrated), Denmark (sales), Eritrea, Estonia, Ethiopia, Guatemala (hydrated), Jamaica, Kenya, Kyrgyzstan, Malawi, Moldova, Mongolia, New Zealand, Nicaragua, North Macedonia, Norway, Panama, Paraguay, Philippines, Qatar, Rwanda, Senegal, Switzerland, Tanzania, Turkmenistan, and Uganda.
