**Geologic and Seismic Investigations
for Relocation of Route 128 at Route 1A
in Dedham, Mass.**

by

James E. Maynard, Geologist, U. S. Geological Survey

General Statement

The proposed relocation of Route 128 in Dedham, Mass. requires a grade separation with long approach cuts at its crossing with Route 1A. In order to obtain information on the configuration and depths of the bedrock surfaces, and on the nature of the overlying material, a geologic study was made of the site, and a program of seismic work was carried out. The work was performed in June, August and September 1953 as part of a cooperative program of the Massachusetts Department of Public Works and the United States Geological Survey.

The area studied is located in the Norwood, Mass. 7-1/2-minute quadrangle map of the United States Geological Survey.

Mr. M. E. Chandler and Mr. W. L. Carney, Department of Public Works' Engineers, performed all pertinent survey work required for this project, and prepared the essential plans and profiles. Mr. Chandler also operated the seismic equipment and assisted in the preparation of the seismic velocity data.

Surface Geology

This site occurs at the intersection of Routes 1A and 128 on the upper boundary between a kame terrace and an undulatory till-bedrock upland. In

general, east of Route 1A, the surface formation is largely sand; west of Route 1A it is mostly till that in the vicinity of the boundary is very sandy. Construction of roads and buildings, and the grading of this surface of the land made it difficult to establish the sand-till boundary without digging numerous test pits; consequently the boundary is not shown on the plan.

Numerous exposures of granitic bedrock occur in the till areas, but none were noted in the sand areas. In general, bedrock appears to be at a shallow depth at this site.

Seismic Traverses

Sixteen seismic traverses were made at this site. The locations of the shot points and the arrangement of the lines are shown on sheets 1 and 2.

Subsurface Interpretation

The geologic sections as interpreted from the surface geology and the seismic data are shown on sheets 3 and 4. All of these sections show bedrock at relatively shallow depths, 4 to 25 feet below the surface of the ground. The bedrock profiles as shown on the sections represent only a generalization of the actual bedrock surface; many small ridges, knobs and depressions may occur at altitudes slightly above and below these profiles. In general, a very irregular and undulatory bedrock surface can be expected at this site.
