DATA ON WATER WELLS IN THE FREMONT VALLEY AREA,
KERN COUNTY, CALIFORNIA

By L. C. Dutcher

PURPOSE AND SCOPE OF THE WORK AND REPORT

The data presented in this tabulation were collected by the U. S. Geological Survey in connection with an investigation of water wells and general hydrologic conditions throughout much of the desert region of southern California. The geologic mapping was financed by Federal funds for arid-regions studies, and the canvass of wells and compilation of data were financed under a cooperative agreement with the California Department of Water Resources.

The desert regions of California are characterized by barren mountain ranges and isolated hills surrounding broad valleys or basins which are underlain by alluvial debris derived from the surrounding highlands. These basins generally contain ground water which has a wide range in chemical quality and which can be and in some areas has been developed for beneficial use.

The general objective of the cooperative investigation is to collect and to tabulate all available hydrologic data for the individual desert basins in order to provide public agencies and the general public with data for use in planning water utilization and management and for use in possible subsequent ground-water investigations.

Accordingly, the scope of the work carried out by the Geological Survey in each area has included: (1) Brief reconnaissance mapping of major geologic features to define the extent and general character of the deposits that contain the ground water; (2) visiting and examining virtually all the water wells in the area; determining and recording their locations in relation to geographic and cultural features and the public-land net, wherever possible; and recording well depths and sizes, types and capacities of installed equipment, uses of the water, and other pertinent information available at the well site; (3) measurement of the depth to the water surface below an established and described measuring point at or near the land surface; (4) selection of representative wells to be measured periodically in order to detect and record changes of water levels; and (5) collection and assembly of well records, including well logs, water-level measurements, and chemical analyses.

The work has been carried on by the U. S. Geological Survey under the general supervision of Harry D. Wilson, Jr., district engineer in charge of ground-water investigations in California, and under the immediate supervision of Fred Kunkel, geologist in charge of the Long Beach subdistrict office.

LOCATION AND GENERAL FEATURES OF THE AREA

The Fremont Valley area covers about 680 square miles and includes most of Fremont Valley and the northeastern part of Antelope Valley as defined by Thompson (1929, pls. 16 and 19) and parts of the Tehachapi, El Paso, and Rand Mountains (pl. 1).

The area of this study lies in the southwestern part of the Mojave Desert region between $117^{\circ}35'$ and $118^{\circ}10'$ west longitude and about $35^{\circ}00'$ and $35^{\circ}25'$ north latitude, north and east of the town of Mojave. The eastern boundary of the area coincides with the Kern and San Bernardino Counties' boundary line at the west edge of the Cuddeback, Superior, and Harper Valleys (Kunkel, 1956); the southern boundary in the Antelope Valley is U. S. Highway 466 (Edwards Air Force Base); and in the Fremont Valley is the Muroc fault at the northeast edge of the Willow Springs, Gloster, and Chaffee areas (Kunkel and others, 1957); the western boundary is the Sierra Nevada; and the northern boundary is the El Paso Mountains.

The area includes one large ground-water basin in Fremont Valley, part of the North Muroc basin north of U. S. Highway 466 in Antelope Valley, and three or more minor basins or subbasins in Antelope Valley in the area east of Castle Butte and south of the Rand Mountains. The large basin in Fremont Valley extends north from Castle Butte to the Sierra Nevada and El Paso Mountains and on the northeast is contained in the narrow depression between the El Paso and Rand Mountains.

The area extending from the Rand Mountains southward to North Muroc basin is, in general, uplifted in relation to the main valley area to the north and west. Granitic rocks (bedrock), volcanic rocks, and virtually impermeable sedimentary rocks of Tertiary age crop out in many hills and in extensive areas of low relief. Many faults strike across the area, and ground water occurs in the small but locally deep depressions bounded by these geologic structures or by hills of impermeable rock.

The surface drainage of the area is of the closed type, and infrequent runoff reaches one or another of the small playas shown on plate 1, or reaches the larger playas known as Koehn Lake, in the northeastern part of Fremont Valley, and Rogers Lake (south of U. S. Highway 466, and not shown on pl. 1) in the northeastern part of Antelope Valley.

The area is shown on all or parts of the following U. S. Geological Survey topographic quadrangle maps: Boron, Castle Butte, Cross Mountain, Kramer, Mojave, Randsburg, and Saltdale, all at a scale of 1:62,500.

Access to the area is provided by U. S. Highways 6 and 466 and several paved and many unpaved roads.

Geographically the area consists mainly of alluvial fans and plains built out from the Sierra Nevada, El Paso, and Rand Mountains. On the east and south the Rosamond Hills, Castle Butte, Desert Butte, and other isolated hills rise above the valley floor.

PREVIOUS INVESTIGATIONS AND ACKNOWLEDGMENTS

Data on ground water in the Fremont Valley area are contained in three reports: U. S. Geological Survey Water-Supply Paper 578, "The Mohave Desert Region, California" (Thompson, 1929, p. 201-223, 289-371), includes data obtained in 1918 on 53 wells in the area of the present investigation; a U. S. Geological Survey open-file report, "Ground-Water Reconnaissance in the Western Part of the Mojave Desert, Calif., with Particular Respect to the Boron Content of Well Water" (Stone, 1957), contains data collected in 1954 on 171 wells in the area; and a private report (Williams, 1930) contains information collected in 1929 and 1930 on 23 wells in the area. The data on wells from all these reports are included herein.

Part of Fremont Valley and vicinity is shown on the geologic maps of the Saltdale and Castle Butte quadrangles by Dibblee (1952 and 1958). The geology shown on plate 1 was compiled and modified from the published maps mentioned above and from unpublished maps of the Boron and Mojave quadrangles by T. W. Dibblee and unpublished maps by the author.

The California Department of Water Resources provided access to all pertinent information in its files, including numerous well logs and chemical analyses. The U. S. Borax and Chemical Corp. and the M and R Sheep and Cattle Co. provided access to a large amount of data in their files, as did many private well owners, well drillers, and others.

The cooperation and assistance given by these people and agencies contributed materially to the completeness of the data presented in this report, and are most gratefully acknowledged.

GEOLOGIC AND HYDROLOGIC FEATURES OF THE AREA

The geologic units in Fremont Valley and vicinity can be grouped into two broad categories: Consolidated rocks and unconsolidated deposits. The consolidated rocks are for the most part impervious and, except for minor amounts of water in cracks and weathered zones, yield little or no water. The consolidated rocks (pl. 1) comprise the old crystalline, metamorphic, and consolidated sedimentary rocks of pre-Tertiary age which collectively form the basement complex (map symbol bc) and the consolidated sedimentary rocks of Tertiary age (map symbol Tc).

The consolidated sedimentary and pyroclastic rocks of Tertiary age (map symbol Tc) are part of the Goler formation of Eocene to early Miocene age and the Ricardo formation of Pliocene age mapped by Dibblee (1952) in the Saltdale quadrangle, and the Tropic group of Miocene(?) and Pliocene(?) age mapped by Dibblee (1958) in the Castle Butte quadrangle. They consist mainly of gray and red conglomerate, arkose, cobble gravel, tuff, sandstone, chert, limestone, gravel, sand, silt, and clay. For the most part these rocks are poorly permeable, but locally where penetrated by deep wells they yield small amounts of water to domestic wells.

Volcanic rocks of acidic composition, mainly andesite, rhyolite, and dacite of Miocene and Pliocene age (map symbol Tav), also occur in the Fremont Valley area. These rocks are part of the Ricardo formation mapped by Dibblee (1952) in the Saltdale quadrangle and the Tropic group mapped by Dibblee (1958) in the Castle Butte quadrangle.

Extrusive and intrusive basalts of Miocene(?) to Pleistocene age (map symbol QTb) also occur in the area. These rocks are part of the Ricardo formation mapped by Dibblee (1952) in the Saltdale quadrangle, the Tropico group mapped by Dibblee (1958) in the Castle Butte quadrangle, and the Black Mountain basalt mapped in the Saltdale quadrangle by Dibblee (1952).

The unconsolidated older alluvium of late Pleistocene age (map symbol Qoal) consists of compact arkosic gravel, sand, silt, and clay. The deposits are weathered, and locally the feldspars have been altered to clay. Near the hills the unit is predominantly gravel but beneath the valley areas it is finer grained and better sorted. Because the older alluvium overlies older fan deposits (Qof) or Tertiary continental rocks (Tc) on which an erosional surface of considerable local relief is present, the thickness of the older alluvium varies greatly from place to place. Where saturated the older alluvium contains the main aquifers in the area.

The older fan deposits of Pleistocene age (map symbol Qof) consist of weakly consolidated fanglomerate or unsorted unbedded boulder gravel occurring as isolated erosional remnants. The materials are mainly of granitic origin but fragments of basalt, andesite, dacite, and metamorphic rocks are common. The unit is nearly everywhere above the water level in wells and is unsaturated. However, the attitude of this unit suggests that locally it extends beneath the younger or older alluvium in the valley and where saturated may yield small quantities of water to deep wells.

The younger alluvium of Recent age (map symbol Qyal) is mostly gravel, sand, and silt, and overlies the older units beneath the central parts of the valleys. These deposits are generally above the water table except in the lower parts of the valley, where they may yield small amounts of water to shallow wells.

The younger fan deposits of Recent age (map symbol Qyf) are mostly poorly sorted boulders, arkosic gravel, sand, silt, and clay derived from nearby hills or mountains. The materials have been transported only a short distance and mainly represent mudflow or slope-wash debris. Near the hills and mountains the younger fan deposits are coarse grained, but they become finer with increasing distance from the areas of active erosion. These deposits are poorly sorted and poorly permeable, are usually above the water table, and are believed to be unpromising sources of water.

Playa deposits of Recent age (map symbol Qp) occur principally at Koehn Lake, the lowest point in Fremont Valley, and at the base level of some minor drainage areas. They consist principally of silt and clay and minor amounts of sand, are of low permeability, and where saturated usually contain water having a moderate to very high dissolved-solids content.

Unconsolidated coarse to fine dune sand (map symbol Qds) occurs in the lower parts of the valleys. The dunes are, in part at least, actively drifting; locally some small interdune playas are included in the area shown as dune sand on plate 1.

Lakeshore deposits of Recent age (map symbol Qls) occur locally near the old shorelines of large perennial lakes which formerly existed in the lowest parts of the valleys. These deposits consist mainly of coarse gravel and sand but are everywhere above the water table, are not saturated, and therefore do not yield water to wells.

In 1958 the water levels in wells in Fremont Valley ranged from above the land surface in the lowest part of the valley near Koehn Lake to more than 625 feet beneath the higher alluvial slopes north of the Muroc fault and more than 400 feet beneath the alluvial fans extending into the valley from the Rand Mountains east of Koehn Lake.

Recharge to the basin occurs by subsurface ground-water outflow from the Chaffee area (Kunkel and others, 1957) and the North Muroc basin through the older alluvium between Desert and Castle Buttes (pl. 1), from runoff from the directly tributary mountains and hills, and in very minor amounts by deep penetration of rain during infrequent periods of heavy precipitation.

The ground water in Fremont Valley is moderately to highly mineralized. The highest concentration of dissolved solids, about 28,000 ppm (parts per million), occurs in shallow wells near Koehn Lake. The waters of best quality are from wells drilled in the alluvial fans and the higher slopes of the younger alluvium in the southwestern part of the valley, where the dissolved-solids content is only about 400 to 600 ppm.

In North Muroc basin (pl. 1) in 1958 the water levels in wells were about 80 to 100 feet below the land surface beneath the central part of the basin and more than 250 feet beneath the higher alluvial slopes near the town of Boron. Ground water in the North Muroc basin moves from the surrounding hills or the adjacent ground-water basins (or subbasins) northwestward between Castle and Desert Buttes, through a low topographic divide underlain by alluvium, to Fremont Valley.

The ground water in the North Muroc basin has a low to moderate concentration of dissolved solids. The highest concentration of dissolved solids, about 1,000 ppm, occurs in wells near Boron. The waters of best quality come from wells drilled near the western part of the basin, where the dissolved-solids content locally is less than 500 ppm.

Three areas are underlain mainly by younger alluvium in the generally uplifted area north of the North Muroc basin and south of the Rand Mountains. Several large northwest-trending faults strike across the area, and bedrock crops out in numerous hills east of Castle Butte. The largest of the three alluvial areas is between the Rand Mountains and the Lockhart fault (pl. 1). The occurrence and movement of ground water in the area is imperfectly known because of the lack of wells. However, meager data suggest that subsurface flow from the area enters either the Harper Valley of Kunkel (1956) or the other and smaller subbasins to the south, and thence enters North Muroc basin.

In the area east of Castle Butte, north of the North Muroc basin and south of the Lockhart fault, there are two valley areas underlain by younger alluvium which contain ground water. Each of these two areas contains several large-capacity irrigation or industrial supply wells.

Recharge to the three valley areas east of Castle Butte occurs mainly from runoff from the local hills and mountains. Discharge occurs by pumping and by subsurface flow to the North Muroc basin and eventually to Fremont Valley.

The quality of water is suitable for most domestic, irrigation, and industrial use.

Of the approximately 700 square miles of the Fremont Valley area, more than half is underlain by consolidated rocks where wells have not been drilled. The valley areas underlain by unconsolidated deposits contain 370 wells which are shown on plate 1 and are described in table 1.

Table 2 lists cross indexes of Geological Survey well numbers and the numbers previously given to the same wells by other workers in the area.

Table 3 lists all available water-level measurements, and table 4 lists all drillers' logs of wells.

Table 5 contains chemical analyses of water from wells. The analyses were made by the agencies shown in the table.

ECONOMIC ASPECTS OF GROUND WATER IN THE AREA

The principal towns in the Fremont Valley area are Randsburg near the northeast margin and Boron near the southeast corner. Boron was named for the borate minerals mined near the town by the U. S. Borax and Chemical Corp. The borate deposit is the largest ever discovered in the United States.

On the basis of economic development, the Fremont Valley area can be divided roughly into three parts. The economy of the southern part of the area, extending from Boron and U. S. Highway 466 to Castle Butte (pl. 1), is based almost entirely on the mining of the borate deposits near Boron, the residential development resulting from the employment of workers at nearby Edwards Air Force Base south of U. S. Highway 466, and commerce with the travelers using the highway.

In Fremont Valley, which extends about from Castle Butte to several miles northeast of Koehn Lake, the economy is based almost wholly on irrigated agriculture. In 1958 roughly 8,000 acres of land was irrigated by pumping ground water at three large and several smaller ranches.

Finally, in the area near Randsburg the economy formerly was based on the mining of gold, silver, tungsten, and other metals and minerals. In recent years, however, many of the mines have closed and only limited mining is now done. In many instances the difficulty of obtaining water is great, and long pipelines have been built from the lower parts of the valley where it is possible to drill large-capacity wells to supply water to the mines and mills.

WELL-NUMBERING SYSTEM

The well-numbering system used in the Fremont Valley area conforms to that used in virtually all ground-water investigations made by the Geological Survey in California since 1940. It has been adopted as official by the California Department of Water Resources and by the California Water Pollution Control Board for use throughout the State.

Wells are assigned numbers according to their location in the rectangular system for the subdivision of public land. For example, in the number 11/8-33L1, assigned to a well shown on plate 1, the part of the number preceding the bar indicates the township (T. 11 N.), the part between the bar and the hyphen indicates the range (R. 8 W.), the number between the hyphen and the letter indicates the section (sec. 33), and the letter indicates the 40-acre subdivision of the section as shown in the accompanying diagram.

| | | | |
|---|---|---|---|
| D | C | B | A |
| E | F | G | H |
| M | L | K | J |
| N | P | Q | R |

Within the 40-acre tract the wells are numbered serially as indicated by the final digit. Thus, well 11/8-33L1 is the first well to be listed in the NE $\frac{1}{4}$ SW $\frac{1}{4}$ sec. 33 (San Bernardino base and meridian).

Similarly, well 32/37-16R1 is in the $SE\frac{1}{4}SE\frac{1}{4}$ sec. 16, T. 32 S., R. 37 E., Mt. Diablo base and meridian. Because all of the wells in the Fremont Valley area are either in the northwest quadrant of the San Bernardino base and meridian lines or in the southeast quadrant of the Mt. Diablo base and meridian lines, the foregoing abbreviations of the township and range are sufficient.

For well numbers where a dash has been substituted for the letter designating the 40-acre tract, the dash indicates that the well is plotted from unverified location descriptions; the indicated sites of such wells were visited but no evidence of a well could be found.

For some wells the letter following the section number is designated X. This indicates that the well has been field located and is accurately plotted with respect to its position on the map, but that the control for the public-land net is too poor to warrant assigning a more accurate location number.

Table 1.- Descriptions of wells in the Fremont Valley area, California

USGS number: The number given is the Geological Survey number assigned to the well according to the system described in the section on the well-numbering system.

Source of data and other numbers: The source of data on each line is indicated by the following symbols: GS, observations and measurements made by the Geological Survey on the dates indicated as well as information reported to the Geological Survey by owners, drillers, or others; DGT, from Thompson (1929); CW, from Cyril Williams, Jr. (1930); DWR, from California Department of Water Resources; Owner, from owner. A number following the letters is the well number used in the reports by Thompson (1929) or Williams (1930).

Date of observation: Data for each well are given in reverse chronological order, with the most recent information summarized on the top line, opposite the well number.

Owner or user: The name given is the owner or user of the well on the date indicated. If more than one set of data are given for a well the name is not repeated unless it is known to be different.

Year completed: The completion date was obtained from the driller's log or reported by the owner or others.

Depth: Depths of wells given in whole feet were reported by owners, drillers, or others; depths given in feet and tenths were measured below land-surface datum by the Geological Survey.

Type of well and diameter: The type of well construction is indicated by symbols as follows: A auger, C cable tool, D dug, DC dug and deepened by cable tool, R rotary, RG rotary gravel-packed well. The number following the letter is the diameter of the casing or pit, in inches, and where no casing was installed the symbol N is used.

Pump type and power: The type of pump or method of lift is indicated as follows: A airlift, B bucket, C centrifugal, J jet, L lift, N none, S submersible, T turbine. The type of power is indicated as follows: D diesel engine, E electric motor of undetermined horsepower (where a number appears in this column it indicates the rated horsepower of an electric motor), G gasoline engine, H hand operated, N none, W windmill.

Yield: The yield of the well in gallons per minute generally is reported by the driller or owner and is not necessarily the maximum capacity of the well.

Specific capacity: The specific capacity of a well is its rate of yield per unit of drawdown of the water level in the well. It is determined by dividing the figure in the Yield column by the drawdown resulting from sustained pumping at that rate; the result is expressed in terms of gallons per minute per foot of drawdown. The yield and drawdown data are principally from tests performed by the California Electric Power Company and reported by well owners and drillers.

Use: Dc duck club, Dm domestic, Ds destroyed or dry, In industrial, Ir irrigation, Ob observation, Ps public supply, RR railroad, S stock, T test hole, Un unused.

22

Measuring point: The point from which the water-level measurement(s) by the Geological Survey are made is described as follows:

| | | |
|--------------------------------------|---------------------------------|----------------------------------|
| <u>Bap</u> bottom of access pipe | <u>Hcc</u> hole in casing cover | <u>Tc</u> top of casing |
| <u>Bpb</u> bottom edge of pump base | <u>Hpb</u> hole in pump base | <u>Tcc</u> top of casing cover |
| <u>Bcc</u> bottom of casing cover | <u>LS</u> land surface | <u>Tcp</u> top of conductor pipe |
| <u>Bdp</u> bottom of discharge pipe | <u>Na</u> no access | <u>Thf</u> top of hole in flange |
| <u>Bnc</u> bottom of notch in casing | <u>Nc</u> notch in casing | <u>Tmc</u> top of masonry curb |
| <u>Edp</u> edge of discharge pipe | <u>Sc</u> slot in casing | <u>Tpb</u> top of pump base |
| <u>Epb</u> edge of pump base | <u>Tap</u> top of access pipe | <u>Tsc</u> top of slot in casing |
| <u>Hc</u> hole in casing | <u>Tbc</u> top of board cover | <u>Twc</u> top of wooden curb |

The suffix letters N, S, E, and W, indicate the side (north, south, east, or west) where used. The distance of the measuring point above or below (-) land-surface datum is given in feet and tenths

and sometimes hundredths. All measurements of water level are from the same measuring point unless otherwise indicated; however, the measuring points used by Thompson (1929), owners, drillers, and California Department of Water Resources are not known.

Altitude: The altitude given is the altitude of land-surface datum, the plane of reference approximately at ground surface, at the well. Altitudes given to the nearest foot were interpolated from Geological Survey topographic maps, those given in feet and tenths were determined by spirit leveling by Cyril Williams, Jr., (1930) or by the well owner.

Depth to water: Measured depths to water level are given in feet, tenths, and hundredths, or feet and tenths; reported or approximate depths to water level are given in whole feet. The water-level measurements are below or above(+) land-surface datum. For the measurements made by the Geological Survey (GS) and Williams (CW, 1930), the difference in altitude between land-surface datum and the measuring point has been subtracted from or added to the measured water level below the measuring point. The measurement given is the depth to water level below or above land-surface datum.

23

Other data: C chemical analysis of water is given in table 5, L driller's log of well is given in table 4, W records of water levels in wells are given in table 3; all known records of water levels in wells in the area are given in either table 1 or 3. E electric log for well in the files of the Geological Survey, R automatic water-level recorder, installed and maintained by the owner, was operating in the well at the time of the Geological Survey field canvass.

e. Pumped recently.

Table 2.- Cross index of other well numbers and
U. S. Geological Survey numbers

The first column shows the number assigned to the well by others and the second column shows the Geological Survey number assigned to the same well. The numbers in the first column are listed consecutively. Numbers missing in the consecutive listings are for wells outside the Fremont Valley and vicinity area or for wells for which no data are available.

Table 3.- Records of water levels in wells

Included are all known records of water-level measurements in wells where six or more measurements have been made; records for wells where less than six measurements have been made are shown in table 1.

Altitudes given are in feet above mean sea level for the land-surface datum at the well. Land-surface datum is a plane of reference which approximates land surface. Altitudes given in whole feet are interpolated from topographic maps. Altitudes given in feet and tenths were determined by spirit leveling/ from records by Cyril Williams, Jr. (1930)/.

Measurements. All measurements of water level have been adjusted to depth below land-surface datum. That is, the altitudes of the measuring points as reported above land-surface datum have been subtracted from the water-level measurements below the described measuring point. Measurements at 14 wells (11/8-32G1, 11/9-17N1, 30N1, 34A1, 29/39-28H1, 30/37-24M1, 30/38-32E1, 30/39-8A1, 31/37-8C1, 13B1, 35N1, 32/37-1N1, 11N1, and 32/38-32N1) are made by the Geological Survey during the spring and autumn each year.

All measurements are by the Geological Survey unless otherwise indicated.

11/8-20H1. D. W. Swanson. Depth 213.9 feet. Altitude about 2,380 feet. Measuring point: Top of casing 0.73 foot above lsd.

|------------------------------|-----|-----|
| Sand, gravel, and clay ----- | 270 | 270 |
|------------------------------|-----|-----|

11/8-2-3. U. S. Borax and Chemical Corp., well 5. Altitude about 2,490 feet. Drilled by owner.

| | | |
|-------------------------------|-----|-----|
| Surface sand and gravel ----- | 332 | 332 |
| Basalt ----- | 20 | 352 |

11/8-2-4. U. S. Borax and Chemical Corp., well 6. Altitude about 2,480 feet. Drilled by owner.

| Material | Thickness (feet) | Depth (feet) |
|-------------------------------|---------------------|-----------------|
| Surface sand and gravel ----- | 326 | 326 |
| Basalt ----- | 18 | 344 |

11/8-3Cl. U. S. Borax and Chemical Corp., well 25. Altitude about 2,490 feet. Drilled by owner in June 1954. 16-inch casing was removed after well was test pumped.

| | | |
|---|-----|-----|
| Sand, clay and gravel; sand, medium to fine-grained, clay light brown, gravel pebble to boulder size ----- | 40 | 40 |
| Gravel and clay; gravel coarse, clay light brown ----- | 12 | 52 |
| Sand, clay and gravel; sand medium-grain, light brown clay and coarse gravel ----- | 133 | 185 |
| Clay and sand; clay light yellowish brown, sand very fine to coarse, subangular ----- | 60 | 245 |
| Clay; bright reddish-brown, plastic possibly some bentonite ----- | 5 | 250 |
| Clay; gray green ----- | 3 | 253 |
| Clay; reddish-brown containing red decomposed inclusions which appear as volcanic origin --- | 12 | 265 |
| Clay; mixed red, green and yellow ----- | 16 | 281 |
| Clay; brick red ----- | 4 | 285 |
| Clay; reddish nodules of clay and yellow decomposed clay inclusions. Some streaks of greenish sandstone ----- | 10 | 295 |
| Clay; mixed red, yellow, brown and gray ----- | 14 | 309 |
| Clay; yellow, hard ----- | 11 | 320 |
| Clay; red and blue with streaks of gravel ----- | 8 | 328 |
| Clay; reddish brown ----- | 17 | 345 |
| Clay; gray with occasional streaks of reddish-brown sandy clay, some altered volcanic ash ----- | 40 | 385 |
| Clay; dark reddish-brown ----- | 15 | 400 |
| Clay; gray-brown with streaks of gray, possibly altered volcanic ash ----- | 40 | 440 |
| Sandstone; gray, fine grain, clay ----- | 9 | 449 |

11/8-3El. U. S. Borax and Chemical Corp., well 13. Altitude about 2,465 feet. Drilled by owner in 1948. Casing removed after well completed.

| | | |
|------------------------------|----|-----|
| Sand, gravel, and silt ----- | 55 | 55 |
| Cemented gravel ----- | 30 | 85 |
| Sandy clay ----- | 13 | 98 |
| Basalt ----- | 72 | 170 |

11/8-3Pl. U. S. Borax and Chemical Corp., well 21. Altitude about 2,466 feet. Drilled by owner in April 1954. 14-inch casing zero to 304 feet, 10-inch casing 304 to 430 feet.

| Material | Thickness (feet) | Depth (feet) |
|---|---------------------|-----------------|
| Sand, clay, gravel; poorly sorted, moderately cemented ----- | 91 | 91 |
| Clay; brown, sandy ----- | 4 | 95 |
| Sand, clay and gravel; sand, medium grain subrounded, quartz, feldspars, some basalt pebbles ----- | 22 | 117 |
| Sand, clay and gravel; sand medium-grained, subrounded, basalt, quartz and feldspar pebbles ranging to 25 mm., clay reddish-brown, moderate cementing ----- | 52 | 169 |
| Gravel, sand and clay; gravel fine, well-sorted, clay reddish-brown as thin stringers ----- | 13 | 182 |
| Clay; brown, sandy ----- | 3 | 185 |
| Gravel, sand and clay; clay reddish-brown possibly contains some bentonite ----- | 12 | 197 |
| Basalt; brecciated or broken, black, contains some opalized material ----- | 35 | 232 |
| Volcanic ash or tuff; reddish brown, bentonitic ----- | 3 | 235 |
| Basalt; brecciated or broken, reddish brown, cellular with secondary quartz filling ----- | 6 | 241 |
| Basalt; black, dense ----- | 41 | 282 |
| Basalt; broken, brownish-red ----- | 13 | 295 |
| Basalt; dense, black ----- | 75 | 370 |
| Basalt; broken, cellular ----- | 30 | 400 |
| Basalt; dense black ----- | 10 | 410 |
| Basalt, broken, soft, contains some fine-grained basaltic sand, possibly a filled fissure or cavity -- | 4 | 414 |
| Basalt; broken, hard, black ----- | 2 | 416 |
| Basalt; soft, black ----- | 3 | 419 |
| Basalt; dense, black, hard with few soft zones; driller reports broken and softer basalt was increasing down section ----- | 11 | 430 |

11/8-3Q1. U. S. Borax and Chemical Corp., well 20. Altitude 2,472.5 feet. Drilled by owner in March 1954. 16-inch casing zero to 266 feet, perforated interval unknown, uncased hole from 266 to 414 feet.

| | | |
|---|-----|-----|
| Sand, clay and gravel, moderately well cemented, occasional granitic boulders ----- | 115 | 115 |
| Sand, clay and gravel, sand increasing, gravel contains some basalt boulders ----- | 60 | 175 |
| Gravel, sandy with streaks of brown clay ----- | 10 | 185 |
| Clay and sand, sand fine grain, poorly sorted, occasional pebbles ----- | 8 | 193 |
| Gravel and sand, some brown clay ----- | 12 | 205 |
| Clay and sandy gravel, poorly sorted ----- | 5 | 210 |
| Gravel and sand ----- | 10 | 220 |
| Clay, sandy with occasional granitic boulders ----- | 5 | 225 |

Continued

11/8-3Q1.--Continued.

| Material | Thickness (feet) | Depth (feet) |
|--|---------------------|-----------------|
| Gravel and sand with some basalt boulders ----- | 13 | 238 |
| Basalt breccia, broken, black, with some red zones ---- | 22 | 260 |
| Basalt, black, dense, alternate zones of easy and hard drilling ----- | 80 | 340 |
| Volcanic ash, white, bedded, tight, tuff ----- | 54 | 394 |
| Basalt, black, dense ----- | 20 | 414 |

11/8-3R1. U. S. Borax and Chemical Corp., well 24. Altitude about 2,471 feet. Drilled by owner in May 1954. 12-inch casing zero to 353 feet; 8-inch casing from 347 to 468 feet; tools in uncased hole from 468 to 500 feet.

| | | |
|---|-----|-----|
| Sand, clay and gravel; poorly sorted, moderately cemented, occasional boulders of basalt ----- | 180 | 180 |
| Sand and gravel with occasional streaks of reddish-brown clay ----- | 25 | 205 |
| Gravel and sand; mostly quartz and feldspars, some basalt boulders ----- | 65 | 270 |
| Basalt; black, broken ----- | 7 | 277 |
| Clay; sandy with some bentonite, reddish-brown, sticky, volcanic ----- | 2 | 279 |
| Basalt; broken, black ----- | 1 | 280 |
| Basalt; broken with streaks of brown ash or clay ----- | 31 | 311 |
| Basalt; broken ----- | 9 | 320 |
| Clay, tuff or volcanic ash, reddish-brown, sandy, contains some bentonite ----- | 5 | 325 |
| Basalt; broken ----- | 17 | 342 |
| Basalt; broken with streaks of reddish-brown clay, some bentonite ----- | 10 | 352 |
| Basalt; dense, hard, black ----- | 19 | 371 |
| Clay; reddish-brown, sandy, volcanic ash or tuff, contains some bentonite ----- | 4 | 375 |
| Basalt; dense, hard, broken with few streaks of clay ----- | 25 | 400 |
| Basalt; black, cellular, soft. Drillers report it contains some water ----- | 19 | 419 |
| Basalt; black, with some streaks of ash or clay ----- | 53 | 472 |
| Clay; volcanic ash or tuff, reddish-brown, sandy, bentonitic ----- | 10 | 482 |
| Basalt; black, dense, hard ----- | 18 | 500 |

11/8-3-2. U. S. Borax and Chemical Corp., well 14. Altitude about 2,500 feet. Drilled by owner in 1948. Casing removed from well.

| | | |
|--------------------------------|----|-----|
| Sand ----- | 43 | 43 |
| Sandy silt ----- | 55 | 98 |
| Gravel ----- | 5 | 103 |
| Cemented sand and gravel ----- | 75 | 178 |
| Broken lava ----- | 32 | 210 |
| Solid basalt ----- | 10 | 220 |

11/8-3-3. U. S. Borax and Chemical Corp., well 15. Altitude about 2,472 feet. Drilled by owner in 1948, casing removed from well.

| Material | Thickness (feet) | Depth (feet) |
|---|---------------------|-----------------|
| Cemented sand and gravel (3-ft seam of loose gravel at 64 ft) ----- | 115 | 115 |
| Sandy clay and gravel ----- | 60 | 175 |
| Loose water-bearing gravel ----- | 10 | 185 |
| Sandy clay and gravel ----- | 40 | 225 |
| Cemented gravel and basalt boulders ----- | 10 | 235 |
| Broken basalt ----- | 7 | 242 |

| Cemented gravel ----- | 13 | 333 |
| Basalt ----- | 71 | 404 |

11/8-15K1. U. S. Borax and Chemical Corp., well 26. Altitude about 2,426 feet. Drilled by Mogle Brothers in September 1954. 14-inch casing zero to 483 feet, perforated 170 to 230 and 360 to 400 feet, uncased hole 483 to 678 feet.

| Material | Thickness (feet) | Depth (feet) |
|--|---------------------|-------------------|
| Topsoil; sandy, light brown, with some gravel ----- | 15 | 15 |
| Sand and clay; sand, coarse to very coarse, buff, subangular, clay, light brown ----- | 95 | 110 |
| Sand, clay and gravel; well mixed, compact, light brown ----- | 12 | 122 |
| Clay; light brown ----- | 32 | 154 |
| Sand, clay and gravel; sand medium to coarse, clay light brown, gravel up to 3/4 inch containing some basalt pebbles ----- | 12 | 166 |
| Clay; sandy, gray, micaceous ----- | 26 | 192 |
| Sand and clay; light gray ----- | 2 | 194 |
| Limestone; white to light gray, hard, siliceous, possibly indurated old caliche zone ----- | 6 | 200 |
| Sand; coarse grain, gray, some pebbles ----- | 10 | 210 |
| Clay; gray green, sandy ----- | 18 | 228 |
| Limestone; white to light gray, hard, siliceous, possibly indurated old caliche zone ----- | 2 | 230 |
| Clay; gray green ----- | 5 | 235 |
| Limestone; gray, possibly large boulder ----- | 1 | 236 |
| Clay; dark green ----- | 33 | 269 |
| Limestone; white to gray, hard, secondary calcite and nodules and bands of siliceous material ----- | 2 $\frac{1}{2}$ | 271 $\frac{1}{2}$ |
| Shale; gray green, hard, dry ----- | 6 | 277 $\frac{1}{2}$ |
| Shale; gray green, with inclusions of volcanic ash or pumice. Inclusions subrounded to rounded make up to 70 percent of sample ----- | 2 $\frac{1}{2}$ | 280 |
| Shale; light gray green ----- | 2 | 282 |
| Shale; dark green, some banding ----- | 5 | 287 |
| Sandstone; gray to buff, calcareous, silty, hard, very fine grain, well-sorted, tight ----- | 1 | 288 |
| Shale; dark gray brown, banded, carbonaceous, micaceous ----- | 2 | 290 |
| Shale; gray green, streaks of yellow material ----- | 8 | 298 |
| Shale; bentonitic, contains volcanic debris, possibly pumice ----- | 2 | 300 |
| Limestone; tan, dolomitic, siliceous, hard, opalized or cherty seams and nodules ----- | 15 | 315 |
| Shale and sandstone; shale light green, sandstone hard, siliceous, fine grain ----- | 5 | 320 |
| Shale; dark gray green, compact ----- | 20 | 340 |
| Shale; sandy with inclusions of basalt and scoria ----- | 2 | 342 |
| Limestone; white, sandy, hard, possibly indurated caliche ----- | 1 | 343 |
| Shale; light gray green, fractured, siliceous ----- | 1 | 344 |
| Sandstone; dark gray-green, hard, containing pebbles of cellular basalt, siliceous ----- | 16 | 360 |
| Clay; brown and coarse gravel, some basalt grains ----- | 23 | 383 |

32/40-31B1. U. S. Borax and Chemical Corp., well 22. Altitude about 2,530 feet. Drilled by owner in April 1954. Uncased hole zero to 290 feet.

| | | |
|---|-----|-----|
| Sand, clay and gravel, hard, moderately well cemented --- | 160 | 160 |
| Sand and gravel with thin zones of brown clay ----- | 15 | 175 |
| Sand, clay and gravel; well mixed, brown, hard ----- | 60 | 235 |
| Clay, brown, hard, sandy, streaks of coarse water gravel at 260 feet ----- | 30 | 265 |
| Sand, clay, gravel, hard ----- | 25 | 290 |

32/40-31Fl. U. S. Borax and Chemical Corp., well 23. Altitude about 2,520 feet. Drilled by owner in April 1954. Uncased hole zero to 500 feet.

| Material | Thickness (feet) | Depth (feet) |
|---|---------------------|-----------------|
| Sand, clay and gravel; sand granitic, clay brown, well mixed, compact, hard ----- | 170 | 170 |
| Sand and gravel; water bearing ----- | 5 | 175 |
| Sand, clay and gravel; brown, well mixed, hard, compact ----- | 95 | 270 |
| Sand and gravel; some streaks of brown clay, gravel increasing down section ----- | 22 | 292 |
| Sand, clay and gravel, brown, well mixed ----- | 138 | 430 |
| Sand; very coarse, poorly sorted, few pebbles and boulders --- | 10 | 440 |
| Clay; sandy, gray ----- | 3 | 443 |
| Gravel; coarse, waterworn, some basalt pebbles, thin streaks of clay and sand ----- | 4 | 447 |
| Clay; sandy, gray ----- | 13 | 460 |
| Sand and gravel, very coarse, poorly sorted, basalt and granitic boulders ----- | 16 | 476 |
| Clay, blue-gray, sandy with occasional gravel streaks ----- | 24 | 500 |

Table 5.- Chemical analyses of water from wells

Constituents: Where the value for sodium is preceded by the letter a it indicates sodium and potassium expressed as sodium. The value for dissolved solids is the analytically determined value reported by the laboratory. The sum of determined constituents is the sum of the tabulated constituents minus approximately half (50.8 percent) of the bicarbonate. Because all the major constituents (except silica in many of the analyses) that commonly occur in ground water were analytically determined, the values for dissolved solids and sum of determined constituents should be approximately the same. Constituents shown in parentheses are values calculated by the Geological Survey, Ground Water Branch. All values have been rounded where necessary to conform to the standards of the Geological Survey, Quality of Water Branch.

Temperature: For the Geological Survey analyses (GW, GP, and QW), where the temperature is given the sample was collected from the pump discharge; where the temperature is omitted the samples were collected mainly from a storage facility at the well. For the other analyses the point of collection was mainly from the pump discharge.

Analyzing laboratory: DWR, State of California, Department of Water Resources; GP, U. S. Geological Survey, Geochemistry and Petrology Branch; GW, U. S. Geological Survey, Ground Water Branch; H, Hornkohl Co.; QW, U. S. Geological Survey, Quality of Water Branch; SE, Smith-Emery Co. For analyses for which the analyzing laboratory is not given the agency from which the analysis was collected is given: CW, Cyril Williams, Jr. (1930); DGT, Thompson (1929); SP, Southern Pacific Co.
