BASINMENT ROCKS IN CALIFORNIA

Compiled by

HERBERT B. SMITH

Assisted by Della I. Lee and Vivian L. Engler

DECEMBER 1959

Basement rocks in California include igneous and metamorphic rocks of Mesozoic and older age; and also include certain indurated, sheared, and slightly metamorphosed sedimentary rocks, isolated occurrences of younger intrusive rocks, and extrusive rocks lying on the previously listed basement rocks. In the Basin and Range Province in eastern California, only Precambrian rocks and larger bodies of later intrusive and metamorphic rocks are considered basement. Elsewhere in the State, basement rocks include sedimentary rocks of Mesozoic and older age, except the lower Jurassic Knoxville Formation and overlying Cretaceous sedimentary rocks heretofore considered post-Franciscan. In particular, the Franciscan formation is referred to basement, as are subsurface rocks in the Santa Maria basin assigned to the undifferentiated Knoxville and Franciscan formations by Woodring and Bramlette (1950) and Dibblee (1950).

Data are from numerous sources including California Division of Oil and Gas, California Division of Mines, U. S. Geological Survey, American Association of Petroleum Geologists, many oil companies and individuals, and secret reports.

REPORTED BASEMENT WELLS

1. is K.B. estimated
2. T.D. or sample depth not reported; "gr" alone means that well reached basement
