^{1/} Semiquantitative spectrographic analyses.^{2/} For plant ash sample analyses.^{3/} Ratio of aluminum in soil over aluminum in plant ash.^{4/} For lithium, value is reported in analyses only as present or absent; a minus symbol means that lithium decreased to below the detection limit from an unknown concentration.^{5/} Ø means that element was unchanged in concentration.^{6/} ± means that element was present in both soil and plant ash, but that amount of change cannot be determined.^{7/} X means that element was below the detection limit in both soil and plant ash.^{8/} For discussion of the special behavior of tin, see text.^{9/} B signifies that sample is a background sample.^{10/} Tundra clump is essentially pure Arenaria arctica.^{11/} Tundra was essentially grass.^{12/} Average gain or loss using only those samples in which values changed.
