

Fig. 44. Known post-1933 seismic epicenters, magnitude 2 and greater, within 50 km. of the Corral Canyon site and all known epicenters, magnitude 4 and greater, within 100 km. of the site, showing relation to larger faults of southern California. Post-1933 epicenters compiled by J. H. Healy of the U.S. Geological Survey from records of California Institute of Technology. Most epicenters are located within 5 to 15 km; within the 50-km. circle those of magnitude 4 and greater on land or along fault zones are located within 5 km. Pre-1934 epicenters from Richter(1958).
