

UNITED STATES DEPARTMENT OF THE INTERIOR
GEOLOGICAL SURVEY

GEOCHEMICAL DATA FROM THE NABESNA A-3 QUADRANGLE, ALASKA

By
D. H. Richter and N. A. Matson, Jr.

Open-file report

1969

69-223

This report is preliminary
and has not been edited or
reviewed for conformity with
Geological Survey standards
or nomenclature.

MAP EXPLANATION

Nabesna A-3 quadrangle,
Alaska

○ ³¹² Pb:150
● ^{Zn:300}
₂₇₁
Stream sediment sample
and number

Solid circle indicates presence of
anomalous elements. Anomalous ele-
ments and their concentration (in
ppm) shown. See Table 1 for addi-
tional analytical data.

▲ 329

Rock sample and number
See Table 2 for sample description
and analytical data.

Altered areas

Conspicuous limonite-staining due
principally to weathering of dis-
seminated sulfides in bedrock.

X

Known copper mineral occurrences in
amygdaloidal basalt unit.

TABLE 1

Analyses of stream sediments
Nabesna (A-3) quadrangle, Alaska

L, detected, but below limit of determination. N, not detected.
Limit of determination shown in parentheses under element.

Sample No.	Concentration (ppm)										
	Au (0.02)	Ag (0.5)	B (10)	Cr (5)	Cu (2)	Mo (2)	Ni (2)	Pb (10)	Sc (5)	V (5)	Zn (200)

Gold by atomic absorption. Analysts: Miller, R., Tripp, R., Friskin, J.G., Rickard, M.

Other elements by semi-quantitative spectrographic. Analysts: Curry, J., Martinez, L., Siems, D.

Description of Samples

Sample No.	Description
AGG 329	Chip sample across 1.5 feet of copper-stained breccia at contact of granodiorite and marble.
AGG 330	Chip sample across 10 feet of limonite-stained amphibolite.
AGG 342	Random grab sample of garnet skarn.
AGG 343	Random chip sample of garnet skarn with hematite-quartz veinlets.
AGG 346	Random chip sample of limonite-stained fault breccia.
AGG 347	Chip sample of carbonatized and silicified fault gouge fragments.
AGG 389	Random float sample of garnet skarn with sulfides.

NOTES

Nabesna A-3 quadrangle, Alaska

- (1) In all analyses, with the exception of gold, the results are reported to the nearest number in the series 1, 0.7, 0.5, 0.3, 0.2, 0.15, 0.1, etc.
- (2) Elements are considered anomalous if they are present in concentrations greater than 3 times mean background. With the exception of amygdaloidal basalt terrane, mean background in the area (Richter and Matson, 1968) closely approximates average crustal abundance, i.e., copper, 55 ppm; lead, 12.5 ppm; zinc, 70 ppm; molybdenum, 1.5 ppm. Background concentrations for copper and certain other elements in amygdaloidal basalt terrane are considerably higher than crustal average, hence samples 278, 301, 302, 305, 306, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321 with copper contents of 150 to 300 ppm are not considered anomalous.
