conformity with U.S. Geological Survey standards.

Maps showing locations of holes drilled in 1948 to
1953 by U.S. Geological Survey, Club Mesa area,
Montrose County, Colorado

Between March 6, 1948, and January 6, 1953, the U.S. Geological Survey drilled 662 diamond-drill holes in the Club Mesa area, Uravan district, Montrose County, Colorado, to explore for uranium-bearing deposits. The deposits are primarily in the Salt Wash Sandstone Member of the Jurassic Morrison Formation.

The maps of the area explored are an index map (fig. 1) and 1 other showing locations of drill holes (fig. 2). Logs of 250 holes identified on the accompanying map may be inspected at the U.S. Geological Survey Library, Building 25, Federal Center, Denver, Colo. 80225, and at the U.S. Atomic Energy Commission Office, Grand Junction, Colo. 81501. The other 412 holes are on land controlled by the U.S. Atomic Energy Commission, and inquiry as to the availability of the logs for them should be directed to that agency.
