This map shows the estimated relative abundance of landslides in the San Francisco Bay region. It should serve as a basis for general comparison and evaluation of inferred landslide susceptibility. The map was prepared by D. H. Radbruch and C. M. Wentworth, and the text, based on the briefs by S. H. Radbruch and C. M. W. Wentworth. It shows a compilation of data collected at various stages of the project. The map includes a legend explaining the symbols used to represent different types of landslides.

The map is based on data from various sources, including aerial photography, topographic maps, and field observations. The symbols used on the map indicate the relative abundance of landslides in different areas. The map is intended to provide a general overview of landslide susceptibility in the region.

The legend explains the symbols used on the map. The map includes a scale bar and a contour interval for reference. The map is available in hardcopy form from the U.S. Geological Survey.
