Saturated Thickness of Unconsolidated Stratified Deposits

By Elinor H. Handman

EXPLANATION

Map shows by lines the thickness of unconsolidated stratified deposits that are saturated at ground level. Where calculated saturated thickness is equal to water-yielding unit material, saturated thickness precisely represents the amount of water-level lowering necessary for development. The map is based on data from many sources including the Department of Environmental Protection's surficial stratigraphic maps. Thick lines show approximate limits of unconsolidated saturated deposits.
