Table 1. Flood stages and discharges in Maryland and Delaware.............................. 15
ABSTRACT

Intense rainfall, resulting mostly from severe thunderstorms in August and September 1971 caused considerable flooding throughout much of Maryland and Delaware. Precipitation totals of 5.47 inches in 3 hours and 12.6 inches in 12 hours were reported for the most severe storm of the period which occurred on Aug. 1-2, and was centered in southeast Baltimore County, Md.

Total storm damage for the 2 months was estimated to exceed 10 million dollars. Fourteen lives were lost and extensive damage was done to homes, businesses, crops, bridges, culverts, and roadways.

Flood discharge data are presented for 75 gaging stations and for 6 miscellaneous sites. New peaks of record occurred at 32 of the gaging stations. The maximum unit peak discharge rate recorded was 2,400 cubic feet per second per square mile.
August and September 1971 in Maryland and Delaware were marked by 3 periods of heavy rainfall; Aug. 1-5, Aug. 26-28, and Sept. 11-14. Within these periods several individual storms caused significant flooding. Particularly severe storms occurred in Baltimore City and southeastern Baltimore County on Aug. 1-2 and in central Maryland and northern Delaware on Sept. 11-13. Less severe storms occurred on Aug. 3-4, Aug. 26-28, and Sept. 13-14.

National Weather Service records indicate that the total rainfall for the 2-month period ranged from 4.37 inches at Crisfield, Md., to 28.47 inches at Towson, Md. The rainfall at Towson during August was 19.99 inches. The greatest monthly total recorded at any National Weather Service station in Maryland or Delaware was 20.35 inches at Leonardtown, Md., in August 1945.

All the storms were characterized by intense and persistent thunderstorms. In addition, the Aug. 26-28 storm period included tropical storm Doria which moved up the coast of Maryland and Delaware on the evening of Aug. 27.

The highest reported rainfall intensities of the 2-month period occurred during the storm of Aug. 1-2, which was centered in southeast Baltimore County, Md. A total of 12.6 inches of rain was reported to have fallen at one site in less than 12 hours (probably less than 10 hours).

The resulting flood damage was fairly localized, but extremely heavy. Fourteen lives were lost and property damage was estimated at 6.5 million dollars (U. S. Environmental Data Service, 1971). This storm accounted for all the loss of life and more than half the property damage sustained during the 2-month period.

The second most severe flooding resulted from the storm of Sept. 11-13. A total of over 13 inches of rain was reported in Newcastle County, Del., and over 9 inches in Montgomery County, Md. Very heavy damage occurred in Montgomery County, Md., primarily in the Seneca Creek basin. Storm damage was estimated to be about 4 million dollars (U. S. Environmental Data Service, 1971).

Included in this report are descriptions of the storms and the resulting flooding. Significant peak stages and discharges in August and September and the previous peaks of record are listed for selected gaging stations. Peaks
at some miscellaneous sites are also included. Figure 1 shows the location of sites for which peak-flow data are given. Detailed descriptions of each site giving the location, drainage area, and type of gage are presented. Isohyetal maps are included to provide a generalized picture of the rainfall associated with the larger storms. Peak unit discharges plotted against drainage areas with superimposed Myers extreme-event curves (National Resources Committee, 1938) are presented.

Factors for converting data from English Units to International System (SI) Units are provided on page 13.

Data from gaging stations which did not experience significant peaks are not included in this report. Information regarding those stations and more detailed runoff data from the stations which are included in the report may be obtained from the U. S. Geological Survey office in Parkville, Md.

This report has been prepared to provide information for government agencies and private organizations that are concerned with water management. Documentation of flood data is a prerequisite to effective drainage-structure design and land-development planning.

The streamflow data in this report were collected by the U. S. Geological Survey in conjunction with its cooperative programs with the Delaware State Highway Department, the Maryland State Highway Administration, the Delaware Geological Survey, the Maryland Geological Survey, and various other Federal, State and private organizations. The cooperation of the National Weather Service in providing precipitation data is gratefully acknowledged.
EXPLANATION
A Flood-measurement site
Reference number corresponds to that with station description and in table 1

Figure 1. Location of Flood-Measurement Sites
DESCRIPTION OF THE STORMS AND FLOODING

August 1-2

On the evening of Aug. 1 severe thunderstorms associated with a stalled frontal system brought heavy rainfall to the greater Baltimore metropolitan area and Harford and Prince Georges Counties in Maryland. Extremely heavy rainfall (fig. 2) occurred over a fairly small area centered in southeast Baltimore County. A bucket survey revealed unofficial totals of 11 inches or more of rain at three sites. The greatest amount was 12.6 inches. This rainfall is believed to have fallen in less than 10 hours. The official National Weather Service gage in Baltimore recorded 5.47 inches within 3 hours.

Severe but fairly localized flooding occurred. Fourteen people were killed as a direct consequence and property damage, resulting primarily from flooding, was estimated at 6.5 million dollars. Bridge and roadway washouts were reported; the most spectacular was a culvert washout at the Whitemarsh Run crossing of U. S. Highway 1.

August 3-4

On the evening of Aug. 3 heavy rainfall from local thunderstorm activity produced more flooding in scattered areas of central Maryland. Precipitation totals of 2.5 to 3.5 inches were fairly common. Storm damage, resulting mainly from flooding, was widespread but much less severe than during the Aug. 1-2 storm.

August 26-28

Tropical storm Doria, which moved up the Atlantic Coast, in conjunction with another weather system already in the area produced very heavy rainfall (fig. 3) throughout Delaware and in Maryland east of Frederick County. The storm began on the evening of Aug. 26 and ended early on the morning of Aug. 28. Rainfall intensities generally were not as great as in the two previous storms but totals were quite high. Rainfall in excess of 6 inches was recorded over a wide area in the northern half of Delaware and the
central and northern parts of Maryland's eastern shore. The greatest rainfall totals reported were 10.10 inches at La Plata, Md., 8.76 inches at Annapolis, Md., and 8.82 inches in eastern Kent County, Md.

Total storm damage (mostly wind related) was extensive but was probably considerably less than a million dollars. Flood damage was relatively minor.

**September 11-13**

Localized torrential rains associated with convective thunderstorm activity fell intermittently over central and northeast Maryland and northern Delaware from the early morning hours of Sept. 11 until the evening of the 13th (fig. 4). A gage in Baltimore City recorded 4.36 inches in 3 hours on Sept. 11. Three-day rainfall totals of over 6 inches were recorded at various sites in central Maryland and northern Delaware. An unofficial 13.43 inches, of which 8.43 inches fell on the 13th, was reported for the 3-day period at a site north of Wilmington, Del. Two sites in west central Montgomery County, Md., reported more than 9 inches (unofficial) on the 11th and 12th.

Severe flood damage occurred in Montgomery County where homes were destroyed in the Seneca Creek floodplain and widespread damage to bridges and roadways was reported. Baltimore City, Baltimore County, and Harford County, Md., all reported considerable damage from flooding. Substantial damage also occurred along the Patuxent River downstream from the T. Howard Duckett Reservoir. Minor flood damage occurred in the Wilmington, Del., metropolitan area. Storm damage throughout the bi-state area was estimated to be about 4 million dollars.

**September 13-14**

Thunderstorms hit Garrett County, Maryland on the night of Sept. 13 and deposited up to 5 inches of rain (unofficial report) in the northwest part of the county. Some minor damage was done to culverts and bridges on secondary roads in the area.

Additional information on the storms described above may be obtained from the U. S. Environmental Data Service (1971).
EXPLANATION

- Isohyetal lines, rainfall in inches

Period, about 1700 hrs Aug. 1 to about 0500 hrs Aug. 2

Figure 2—Isohyetal Map, August 1-2, 1971
Figure 3—Isohyetal Map, August 26-28, 1971

EXPLANATION

Isohyetal lines, rainfall in inches.
Isohyetal lines, rainfall in inches.
Adapted from Climatological Data Maryland and Delaware, U.S. Department of Commerce.

Figure 4 - Isohyetal Map, September 11-13, 1971
Isohyetal maps which show the general pattern of rainfall are presented for the storms of Aug. 1-2 (fig. 2), Aug. 26-28 (fig. 3), and Sept. 11-13 (fig. 4). It should be noted that the temporal distribution of rainfall and timing of peaks were quite variable within the storm periods. Consequently the isohyetal maps can be misleading. In other words, much of the rainfall shown on an isohyetal map may have come too far before a given streamflow peak to contribute directly to that peak. For example the runoff from rainfall that occurred early within a storm may have passed through a given drainage basin (especially in the case of a small basin) before the flood producing rainfall occurred. Conversely, some of the rainfall shown on an isohyetal map may have occurred after a given flood peak and therefore may not have contributed to that peak. Also, it is certain that substantially more rainfall occurred in some localities and less in others than can be inferred from the isohyetal maps. This difficulty results from the high areal variability of the intense thunderstorm rainfall compared to the relatively low density rain gage network from which the maps were developed.

Therefore, if one wants to relate rainfall to runoff on more than a casual basis, it will be necessary to interpret individual gaging-stations' flood hydrographs in relation to specific nearby rain records.
Peak stages and discharges are presented in table 1 for 75 stream-gaging stations (53 continuous-record, 5 flood-hydrograph, and 17 crest-stage). Recurrence intervals and comparative data for previous floods are included. Peak discharges at 6 miscellaneous sites are also presented.

The following factors may be used to convert data from the English Units published herein to the International System of Units (SI).

</table>

The station numbers in table 1 are in downstream order and are the same as those used in annual U. S. Geological Survey streamflow reports. Reference numbers also have been assigned to each station for ease of identification on the location map (fig. 1).

The years listed in table 1 under the heading "Maximum flood previously known" are water years (October 1 to September 30). For example, the 1970 water year runs from October 1969 through September 1970

Recurrence intervals for peak discharges have been included for sites where this information is available.
A recurrence interval, as applied to flood events, is the average interval of years during which a given peak discharge can be expected to be equaled or exceeded once. It is inversely related to the chance of the peak being equaled or exceeded in any one year. Thus, a 20-year flood would have 1 chance in 20 (5-percent chance) of being equaled or exceeded in any one year.

The flood recurrence intervals included in table 1 were determined by straight-line interpolation from flood-frequency tables listing 2-, 5-, 10-, 25-, and 50-year instantaneous peaks. The base flood-frequency data in these tables were developed by "log-Pearson Type III" analyses. Most of these base data were presented by Walker (1971) or by Cushing, Kantrowitz, and Taylor (1973). For some sites which had short records of peak flows, the base flood-frequency data were estimated for high recurrence intervals. Recurrence interval data included in this report derived from estimated base data are qualified in the footnotes. In general, peaks believed to have recurrence intervals of less than 3 years are not included in this report. The recurrence intervals listed may be too high for urban or urbanizing areas.

Figure 5 shows the flood discharges in cubic feet per second per square mile for the peaks plotted against the corresponding drainage areas. Discharges of less than 10 cfs per sq mi were not plotted. Curves depicting Myers ratings of 30 and 100 are superimposed on figure 5. These curves represent a form of the Myers extreme-flood formula which is:

\[
q = \frac{C_m}{\sqrt{M}}
\]

where \(q\) is the peak discharge in cfs per sq mi, \(C_m\) is a coefficient which equals the Myers rating number times 100 and varies with locality, and \(M\) is the area of the drainage basin in square miles. Myers ratings are sometimes used as a frame of reference to judge relative magnitudes of floods.

**Notes:**
- a: Ratio of peak discharge to estimated 50-year flood.
- b: From outside source of information.
- c: Probably affected by backwater.
- d: Discharge unknown.
- e: Revised.
- f: From floodmarks.
- g: From high-water mark on crest-stage gage.
- h: From graph based on gage readings.
- i: From high-water mark in gage shelter.
- j: Flow regulated since 1951 by Pine Grove Reservoir.
- k: 7.66 ft in gage well, 7.88 ft from floodmarks.
- l: 4.98 ft from recorder, 5.55 ft from floodmarks.
- m: Maximum stage known since at least 1888.
- n: About.
- p: 11.35 ft in gage well, 13.32 ft from floodmark.
- q: From maximum stage indicator in gage shelter.
- s: From graph based on digital recorder recording at 15-minute intervals.
- t: Flow from 305 of the 347 sq mi above this site regulated by Loch Raven Reservoir. It is reasonably certain that Loch Raven contributed less than 2,000 ft of the 19,700 cfs measured at this site.
- u: Based on drainage area relation with Brien Run near Middle River, Md.
- v: Flow regulated since 1954 by Liberty Reservoir.
- w: Estimated.
- x: Flow regulated by T. Howard Ducket Reservoir and Triadelphia Reservoir.
- y: 10.34 ft in gage well, 10.77 ft from outside gage.
- z: Ratio of peak discharge to 50-year flood.
- *: Flow regulated by Needwood Lake and Bernard Frank Lake.
- †: Different datum from 1971 peaks.
1. Numbers correspond to those in Table I.
2. Only the largest peak for the Aug–Sept period is plotted for each site.
3. Peaks under 10 cfs/m are omitted.

Figure 5 — Relation of peak unit discharge to drainage area, floods of August and September, 1971

Station Descriptions

Descriptions of the stream-gaging stations and miscellaneous sites for which peak flow data appear in this report are given on the following pages. The descriptions include location, drainage area, and type of gage at each site. The number preceding the station name is a reference number that can be used to facilitate locating a station on figure 1 or in table 1. The number in parentheses after the station name is a U. S. Geological Survey identification number.
1 MATSON RUN AT WILMINGTON, DEL. (01477790).
DRAINAGE AREA.--0.94 sq mi.
GAGE.--No gage, miscellaneous site.

2 SHELLPOT CREEK AT WILMINGTON, DEL. (01477800).
LOCATION.--Lat 39°45'39", long 75°31'10", New Castle County, 100 ft east of intersection of Forty-fourth and Pine Streets, in Clifton Park in Wilmington.
DRAINAGE AREA.--7.46 sq mi.
GAGE.--Continuous record.

3 WHITE CLAY CREEK NEAR NEWARK, DEL. (01479000).
LOCATION.--Lat 39°42'01", long 75°41'00", New Castle County, 300 ft upstream from Baltimore and Ohio Railroad bridge, 3.5 miles east of Newark.
DRAINAGE AREA.--87.8 sq mi.
GAGE.--Continuous record.

4 RED CLAY CREEK NEAR WOODDALE, DEL. (01480000).
LOCATION.--Lat 39°45'52", long 75°38'08", New Castle County, at State Highway 48, 0.3 mile south of Wooddale.
DRAINAGE AREA.--47.0 sq mi.
GAGE.--Continuous record.

5 LITTLE MILL CREEK AT ELSMERE, DEL. (01480100).
LOCATION.--Lat 39°44'05", long 75°35'14", New Castle County, at North duPont Road in Elsmere.
DRAINAGE AREA.--6.70 sq mi.
GAGE.--Continuous record.

6 BRANDYWINE CREEK TRIBUTARY NEAR CENTERVILLE, DEL. (01481200).
LOCATION.--Lat 39°50'08", long 75°35'57", New Castle County, at State Highway 100, 1.4 miles northeast of Centerville.
DRAINAGE AREA.--0.97 sq mi.
GAGE.--Crest stage.

7 WILLOW RUN AT ROCKLAND, DEL. (01481450).
LOCATION.--Lat 39°47'32", long 75°33'16", New Castle County, at Country Club Drive, 1.0 mile east of Rockland.
DRAINAGE AREA.--0.37 sq mi.
GAGE.--Crest stage.
8 BRANDYWINE CREEK AT WILMINGTON, DEL. (01481500).

LOCATION.--Lat 39°46'09", long 75°34'25", New Castle County, in Rockford Park, 0.2 mile downstream from Henry Clay Bridge in Wilmington.

DRAINAGE AREA.--314 sq mi.

GAGE.--Continuous record.

9 BLACKBIRD CREEK AT BLACKBIRD, DEL. (01483200).

LOCATION.--Lat 39°21'58", Long 75°40'10", New Castle County, at highway bridge, 0.6 mile southwest of Blackbird, and 5.6 miles northwest of Smyrna.

DRAINAGE AREA.--3.85 sq mi.

GAGE.--Continuous record.

10 BEAVERDAM CREEK NEAR MILTON, DEL. (01484270).

LOCATION.--Lat 38°45'41", long 75°16'03", Sussex County, at Road No. 88, 2.5 miles east of Milton.

DRAINAGE AREA.--6.10 sq mi.

GAGE.--Flood hydrograph.

11 SOWBRIDGE BRANCH NEAR MILTON, DEL. (01484300).

LOCATION.--Lat 38°48'51", long 75°19'39", Sussex County, at highway bridge, 1 mile downstream from Reynolds Pond, and 2.5 miles north of Milton.

DRAINAGE AREA.--7.08 sq mi.

GAGE.--Continuous record.

12 STOCKLEY BRANCH AT STOCKLEY, DEL. (01484500).

LOCATION.--Lat 38°38'19", long 75°20'31", Sussex County, at highway bridge in Stockley, 4.4 miles southeast of Georgetown.

DRAINAGE AREA.--5.24 sq mi.

GAGE.--Continuous record.

13 OLDTOWN BRANCH AT GOLDSBORO, MD. (01490800).

LOCATION.--Lat 39°01'23", long 75°47'16", Caroline County, at State Highway 313, 0.7 mile south of Goldsboro.

DRAINAGE AREA.--3.9 sq mi.

GAGE.--Crest stage.

14 BEAVERDAM BRANCH AT MATTHEWS, MD. (01492000).

LOCATION.--Lat 38°48'41", long 75°58'15", Talbot County, at State Highway 328, 1 mile west of Matthews.

DRAINAGE AREA.--5.85 sq mi.

GAGE.--Continuous record.
15 UNICORN BRANCH NEAR MILLINGTON, MD. (01493000).

LOCATION.--Lat 39°14'59", long 75°51'40", Kent County, at State Highway 313, 1.4 miles southwest of Millington.

DRAINAGE AREA.--22.3 sq mi.

GAGE.--Continuous record.

16 MORGAN CREEK NEAR KENNEDYVILLE, MD. (01493500).

LOCATION.--Lat 39°16'48", long 76°00'54", Kent County, 200 ft upstream from highway bridge, 2 miles southwest of Kennedyville, and 4.5 miles upstream from mouth.

DRAINAGE AREA.--10.5 sq mi.

GAGE.--Continuous record.

17 BROWN'S BRANCH TRIBUTARY NEAR CHURCH HILL, MD. (01494020).

LOCATION.--Lat 39°10'05", long 75°58'41", Queen Annes County, at John Powell Road, 1.8 miles north of Church Hill.

DRAINAGE AREA.--1.7 sq mi.

GAGE.--Crest stage.

18 NORTHEAST CREEK AT LESLIE, MD. (01496000).

LOCATION.--Lat 39°37'38", long 76°02'27", Cecil County, at highway bridge, 0.7 mile northeast of Leslie, and 1.5 miles southeast of Bay View.

DRAINAGE AREA.--24.3 sq mi.

GAGE.--Continuous record.

19 PRINCIPIO CREEK NEAR PRINCIPIO FURNACE, MD. (01496200).

LOCATION.--Lat 39°37'34", long 76°02'27", Cecil County, 55 ft downstream from highway bridge on Belvedere Road, 3.5 miles north of Principio Furnace.

DRAINAGE AREA.--9.03 sq mi.

GAGE.--Continuous record.

20 OCTORARO CREEK NEAR RISING SUN, MD. (01578500).

LOCATION.--Lat 39°41'24", long 76°06'43", Cecil County, at Porter Bridge, 300 ft downstream from Love Run, and 3.5 miles west of Rising Sun.

DRAINAGE AREA.--193 sq mi.

GAGE.--Continuous record.

21 BASIN RUN AT LIBERTY GROVE, MD. (01579000).

LOCATION.--Lat 39°39'30", long 76°06'10", Cecil County, 100 ft upstream from highway bridge, 0.9 mile east of Liberty Grove, and 1.0 mile southwest of Colora.

DRAINAGE AREA.--5.31 sq mi.

GAGE.--Flood hydrograph.
22 DEER CREEK AT ROCKS, MD. (01580000).
LOCATION.--Lat 39°37'49", long 76°24'13", Harford County, 0.3 mile upstream from highway bridge on Cherry Hill Road, 0.8 mile southeast of Rocks.
DRAINAGE AREA.--94.4 sq mi.
GAGE.--Continuous record.

23 DEER CREEK NEAR KALMIA, MD. (01580200).
LOCATION.--Lat 39°37'16", long 76°17'57", Harford County, at U. S. Highway 1, 1 mile north of Kalmia.
DRAINAGE AREA.--125 sq mi.
GAGE.--Continuous record.

24 BYNUM RUN AT BEL AIR, MD. (01581500).
LOCATION.--Lat 39°32'30", long 76°19'50", Harford County, at State Highway 22, 1.0 mile east of Bel Air.
DRAINAGE AREA.--8.52 sq mi.
GAGE.--Crest stage.

25 WINTERS RUN NEAR BENSON, MD. (01581700).
LOCATION.--Lat 39°31'12", long 76°22'24", Harford County, at U. S. Highway 1, 1.2 miles northeast of Benson.
DRAINAGE AREA.--34.8 sq mi.
GAGE.--Continuous record.

26 LITTLE FALLS AT BLUE MOUNT, MD. (01582000).
LOCATION.--Lat 39°36'16", long 76°37'16", Baltimore County, at Pennsylvania Railroad bridge, 0.2 mile north of Blue Mount, and 1.2 miles south of White Hall.
DRAINAGE AREA.--52.9 sq mi.
GAGE.--Continuous record.

27 PINEY CREEK NEAR HEREFORD, MD. (01582510).
LOCATION.--Lat 39°34'38", long 76°40'39", Baltimore County, at Interstate Highway 83, 1.1 miles southwest of Hereford.
DRAINAGE AREA.--1.5 sq mi.
GAGE.--Crest stage.

28 WESTERN RUN TRIBUTARY AT WESTERN RUN, MD. (01583495).
LOCATION.--Lat 39°31'01", long 76°41'04", Baltimore County, at Western Run Road, 0.3 mile northwest of Western Run, and 3.0 miles northwest of Cockeysville.
DRAINAGE AREA.--0.26 sq mi.
