THE U.S. Geological Survey is preparing a new series of maps in cooperation with the Department of Housing and Urban Development. This series represents a major expansion of the national mapping program and is designed to meet the national planning and resource management requirements resulting from the 1968 Civil Rights Act. These maps are intended for use in the planning and management of urban and suburban areas, and they will be used in the adjustment of present land use and for the assessment of the future resource and environmental needs of the nation.

The theme of the new series is: "Reconnaissance Photointerpretation Map of Landslides in 24 Selected 7.5-Minute Quadrangles in Lake, Napa, Solano, and Sonoma Counties, California." This map is preliminary and has not been coordinated with the existing 1:24,000 U.S. Geological Survey quadrangles. The purpose of this map is to provide a preliminary map showing the areas where landslides have occurred and the types of landslides that are occurring in these areas. The areas shown on the map should not be considered to be definitive or complete. The map was prepared by M. J. Dwyer, H. Noguchi, and J. O'Rourke.

The symbols used on the map are as follows:

- **Landslide Zone:** Areas where landslides have occurred or are likely to occur. These areas are shown in red.
- **Large Landslide Deposits:** Depositional areas associated with large landslides. These areas are shown in green.
- **Small Landslide Deposits:** Depositional areas associated with small landslides. These areas are shown in blue.
- **Soil Creep:** Areas where soil creep is occurring. These areas are shown in black.

The map is intended to be used in conjunction with other maps and data to provide a comprehensive view of the landslides and soil creep areas in California. The map is available from the U.S. Geological Survey, 345 Middlefield Road, Menlo Park, California 94025.
