In the fall of 1962 the first stage of a larger exploratory program was conducted in the southern part of a 160-acre concession controlled by Consolidation Copper Co. A sample of the concession was selected and sampled by the Bureau of Mines, Department of the Interior. The samples were collected and analyzed by the Consolidation Copper Co. and the results of these analyses were made available to the Bureau of Mines.

The samples were collected by hand using a standard protocol. The samples consisted of 20 equal parts of the ore. The samples were then dried and ground to pass a 200-mesh screen. The samples were then analyzed for copper, molybdenum, and other elements using standard methods.

It is important to note that the results of these analyses should not be used for commercial purposes without further verification. The Bureau of Mines does not guarantee the accuracy of these results and they are provided for information purposes only.

The Bureau of Mines would like to thank Consolidation Copper Co. for their cooperation and assistance in this project.

This report was prepared by the US Bureau of Mines and is available for public viewing.
