CONVERSION FACTORS

For readers who prefer metric units rather than English units, the conversion factors for the terms used in this report are listed below:

Multiply English unit	*By*	*To obtain metric unit*
acres	4.047×10^{-3}	square kilometers
ft (feet)	3.048×10^{-1}	meters
gal (gallons)	3.785	liters
gal/min (gallons per minute)	6.308×10^{-2}	liters per second
(gal/min)/ft (gallons per minute per foot)	2.070×10^{-1}	liters per second per meter
in (inches)	2.540×10	millimeters
lbs (pounds)	4.536×10^{-1}	kilograms
lbs/gal (pounds per gallon)	1.198×10^{-1}	kilograms per liter
mi (miles)	1.609	kilometers

SUMMARY OF BASIC HYDROLOGIC DATA COLLECTED AT COSO HOT SPRINGS, INYO COUNTY, CALIFORNIA

By W. R. Moyle, Jr.

ABSTRACT

More than 200 wells and springs were visited within a 20-mile radius of Coso Hot Springs. Hydrologic and geothermal data were collected for each well or spring site and are tabulated in this report. The data included information such as depth, chemical quality, temperature and specific conductance of water, quantity of flow, well construction, and well logs. These data show that the normal temperature gradient in the ground is about 1.1° Celsius (2° Fahrenheit) per 100 feet. Data also show that the temperature gradient in the thermal areas is as high as 24.4° Celsius (44° Fahrenheit) per 100 feet. The highest temperature measured for all the wells and springs was 142.2° Celsius (288° Fahrenheit).

The chemical quality of water in the study area is generally good except in areas where water evaporates from land surface at Owens Valley playa or where steam escapes into the atmosphere from land surface.

Computerized hydrologic and geothermal data are being stored for future use at the U.S. Geological Survey office, Laguna Niguel, Calif.

INTRODUCTION

Coso Hot Springs is in the southwest corner of Inyo County, Calif. (pl. 1), about 140 mi north of Los Angeles.

The first published data on hot water at Coso Hot Springs described a sample collected by Lieutenant R. Birnie, Jr., in 1875 and analyzed by Oscar Loew (1876). The hot springs, however, were known to Indians, miners, explorers, and settlers before 1875. Most of the attempts to develop the area around Coso Hot Springs have failed. Development has included mining pumice and mercury, bottling Coso volcanic water for medicinal purposes, and using the hot springs as a spa for steam baths. Since 1945 the principal use of the area has been as a test range for the U.S. Naval Weapons Center at China Lake, Calif.

PURPOSE AND SCOPE

The purpose of this study was to collect all basic hydrologic information on wells and springs throughout the Coso Hot Springs area for use by investigators studying the potential of the geothermal resource of the area. The scope of the study included a visit to all known wells and springs near Coso Hot Springs and selected wells and springs as far as 20 mi from the hot springs.

During the visits to the wells and springs, hydrologic data were collected, and previously obtained data were correlated with the proper spring or well. The data collected included measurement of the temperature, specific conductance, amount of flow, well construction, and location. Previously obtained data correlated with each well or spring generally included well logs, chemical analyses, well yield and spring flow, water levels, and temperature measurements.

This report lists the data collected (tables 1-6) and also includes a list of references that contain data on hydrology and other subjects related to the study of geothermal resources in the Coso Hot Springs area.

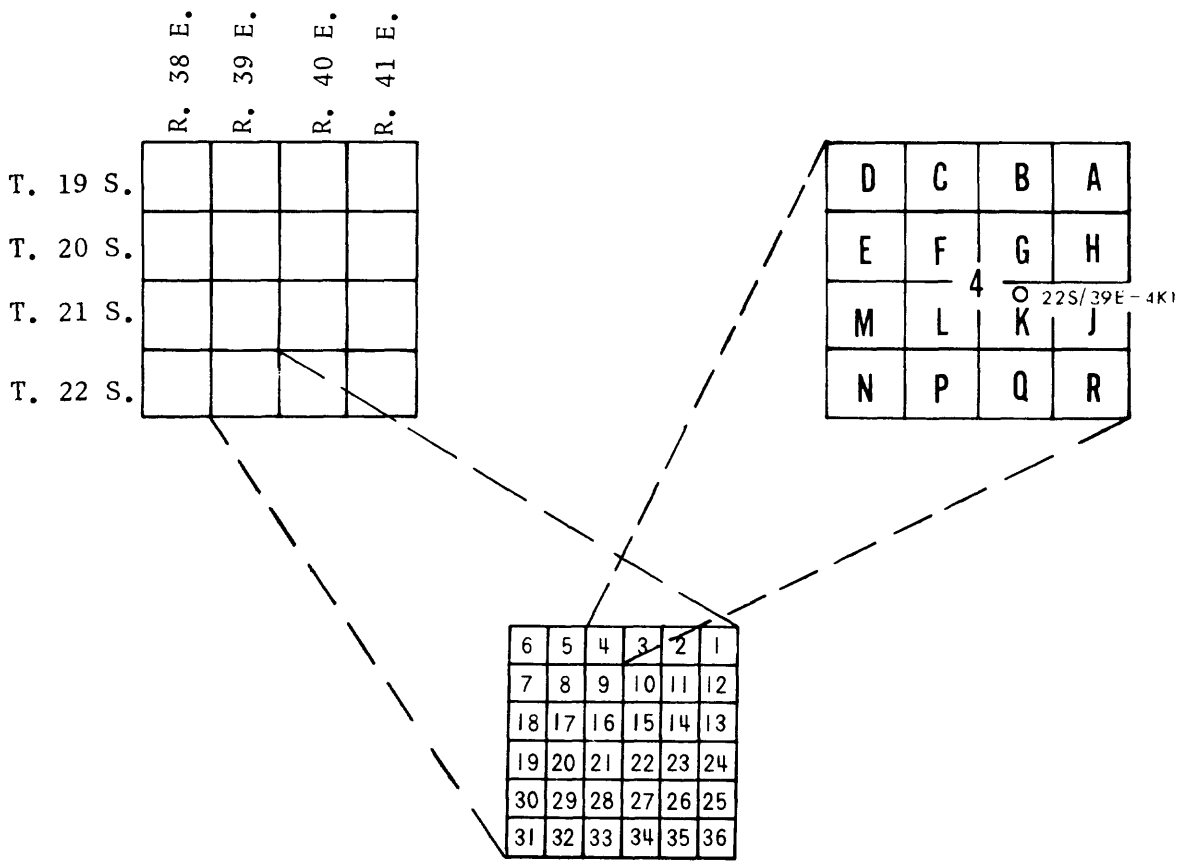
WELL AND SPRING DATA

During the study, more than 200 wells and springs were visited and various types of hydrologic and geothermal data were collected or correlated for each site. The data were coded for computer storage and retrieval. The information is stored at the U.S. Geological Survey office, Laguna Federal Building, 24000 Avila Road, Laguna Niguel, Calif. 92677. The location of each well and spring visited is shown on plate 1.

WELL- AND SPRING-NUMBERING SYSTEM

Wells are numbered according to their location in the rectangular system for the subdivision of public land. That part of the number preceding the slash, as in 22S/39E-4K1, indicates the township (T. 22 S.); the number after the slash indicates the range (R. 39 E.); the number after the dash indicates the section (sec. 4); the letter after the section number indicates the 40-acre subdivision of the section according to the lettered diagram below. The final digit is a serial number for wells in each 40-acre subdivision. The area lies entirely in the southeast quadrant of the Mount Diablo base line and meridian.

Springs are numbered similarly, except that the letter S is placed between the 40-acre subdivision letter and the final digit, as shown in the following spring number: 22S/37E-33HS1.



GEOTHERMAL AREAS

Several areas where hot water, steam, or hot ground is at or near land surface will be discussed individually.

Coso Hot Springs

One of the most obvious areas of geothermal activity is at Coso Hot Springs in sec. 4, T. 22 S., R. 39 E. This area contains more than 40 steam wells, ranging in depth from a few feet to 375 ft, and numerous mud pots, fumaroles, and small hot pools. The temperature at land surface, if not cooled by the air, is generally about 96.5°C (206°F). This is the boiling point of water at the altitude of 3,600 ft. At Coso Hot Springs the temperature in the deepest well (22S/39E-4H8) ranges from 98°C (208°F) as slightly superheated steam at the top of the casing to 142°C (288°F) at the bottom of the well. Figure 1 shows that the temperature in this well increases at a rate of about 24.4°C (44°F) per 100 ft of depth below the regional water table. The water table in this 375-ft deep well is about 120 ft below land surface. This well reportedly penetrates fractured granitic rocks.

On December 14, 1960, an air-cooled condenser and discharge line were installed on well 22S/39E-4K3 by the author. This condenser caused 3 gal/min of water to condense from steam and flow from the discharge line. Not all steam from this well was condensed into water; some was dissipated into the air. To boil 1 gal of water at atmospheric pressure requires 7,750 Btu (British thermal units). Water weighs 8.01 lbs/gal at 96.5°C (boiling temperature at the well site), so 3 gal weighs about 24 lbs. The thermal energy produced by this well was, therefore, about 190,000 Btu per minute or 3,200 Btu per second. One horsepower equals 0.707 Btu per second; therefore, the minimum total heat energy produced from this well was about 2,300 horsepower. If 10 percent of this heat energy could be converted into electrical power (a reasonable assumption), it would equal about 170 kilowatts.

Devils Kitchen and Nicol Area

The Devils Kitchen is in secs. 7 and 8, T. 22 S., R. 39 E., and the Nicol area is in secs. 5 and 8, T. 22 S., R. 39 E. Numerous shallow test holes were drilled for the exploration of mercury in the spring of 1941 in these two areas. The highest measured temperature reported in these test holes was 110°C (230°F) in 1941. Only a few of these steaming test holes were still in existence in 1976.

Wheeler Prospect

The Wheeler Prospect, in sec. 16, T. 22 S., R. 39 E., was originally mined for mercury prior to 1945. The temperature of the ground at this site is normally slightly above 93.3°C (200°F), depending on the ambient air temperature. The ground emits some steam indicating that the temperature is near boiling (96.5°C or 206°F) within a few feet of land surface.

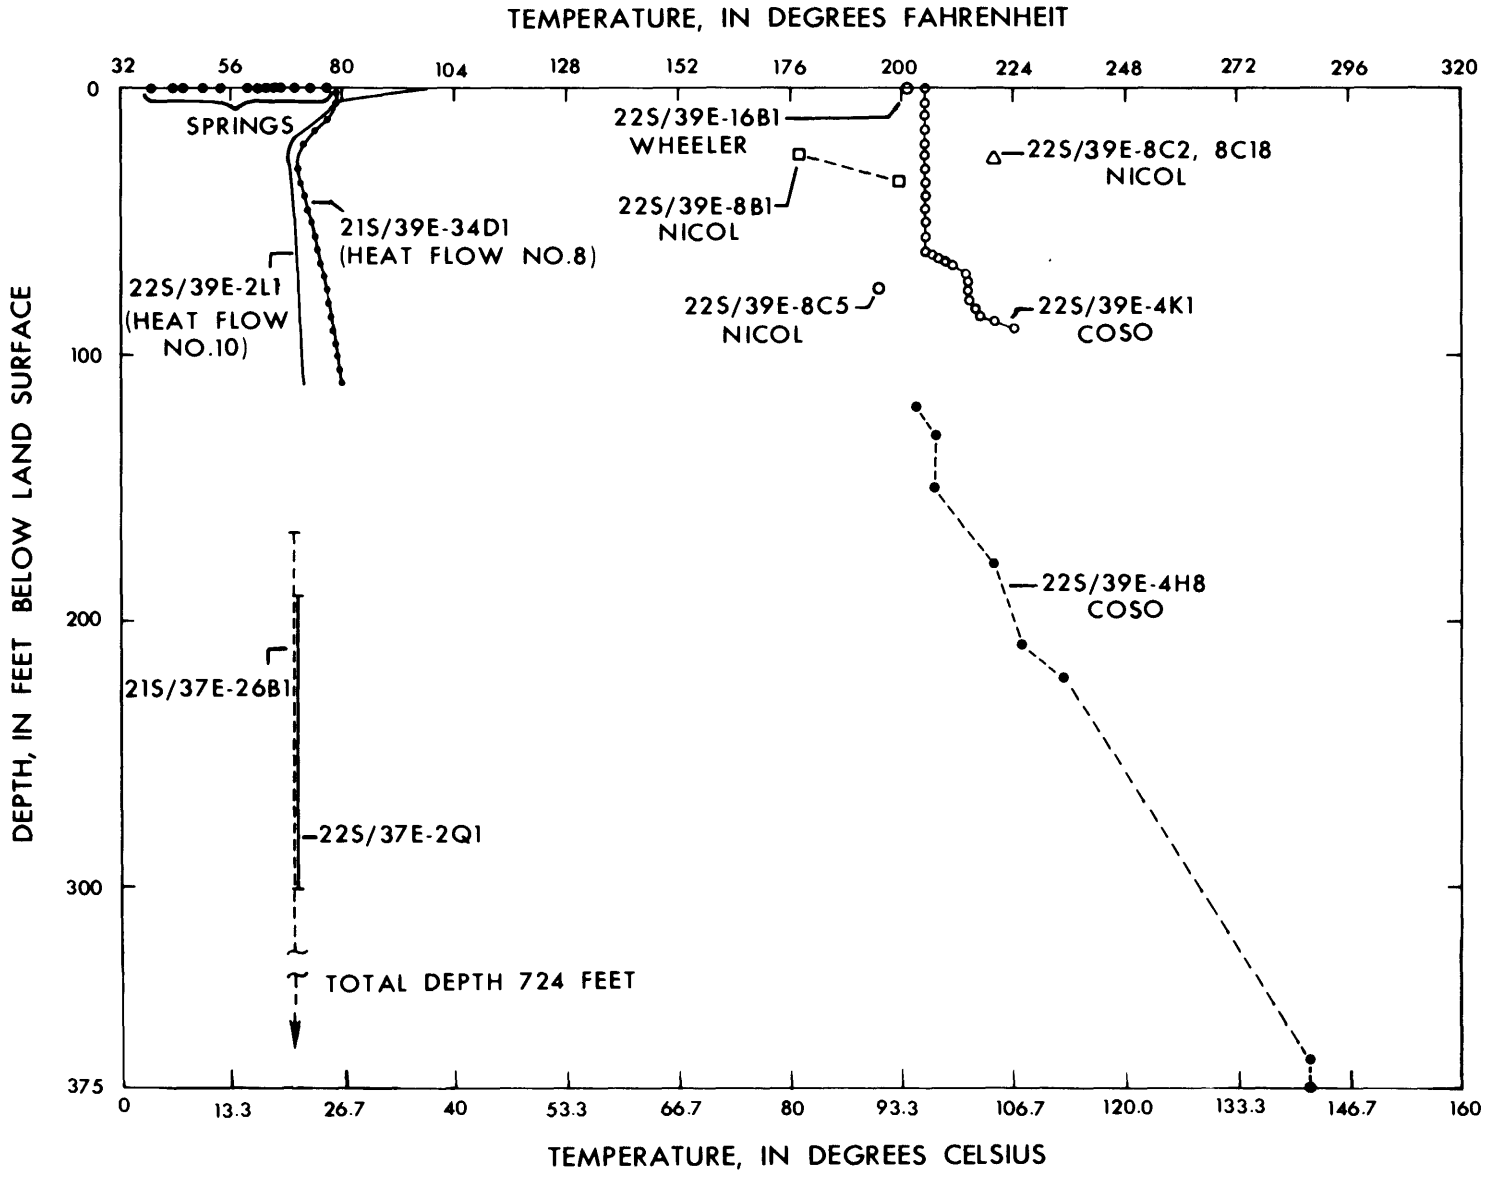


FIGURE 1.--Temperature measurements in wells and springs.

Sugarloaf Mountain

Two areas adjacent to Sugarloaf Mountain contain hot ground. One area is west of Sugarloaf Mountain near the common ¼ corner between secs. 11 and 12, T. 22 S., R. 38 E., and the second area is northeast of Sugarloaf Mountain near the common ¼ corner between secs. 6 and 7, T. 22 S., R. 38 E. West of Sugarloaf Mountain are four wells; two emit steam and two do not. The area northeast of Sugarloaf Mountain is at the bottom of an explosion crater. The temperature 1 ft below ground surface in this crater measured 49°C (120°F) while the air temperature was only 16.5°C (62°F).

North of Coso Hot Springs

Just north of Coso Hot Springs is heat flow well number 8 (U.S. Geological Survey No. 21S/39E-34D1). Numbers were applied to all heat flow wells by Jim Combs, University of Texas at Dallas. Combs' data are published in the U.S. Energy Research and Development Administration (1975) report listed in the references. The temperature gradient in this well is about 6.7°C (12°F) per 100 ft (fig. 1). This gradient is between the high temperature gradient at Coso Hot Springs and the normal temperature gradient outside the geothermal area. This well was not measured to its full depth by the author because the line on the thermistor probe was only 110 ft long. The total depth of the well when drilled was reported as 118 ft.

NON-GEOTHERMAL AREAS

Heatflow well number 10 (22S/39E-2L1) about 2 mi east of Coso Hot Springs has a temperature gradient of 1.1°C (2°F) per 100 ft of depth (fig. 1). This seems to be the normal geothermal gradient in most areas surrounding Coso Hot Springs.

Temperature of water pumped from wells indicates the average formation temperature because the discharge of most wells is sufficiently large to prevent cooling (or heating) of the water by the air at the land surface. In Rose Valley most of the water pumped from wells indicates the average temperature is about 21°C (70°F) between the water table and a depth of 724 ft.

WATER QUALITY

The specific-conductance measurements and the chemical analyses of water from many of the wells and springs surrounding Coso Hot Springs indicate that the water is of good chemical quality except in a few wells. In general, poor quality is directly related to the evaporation of water from land surface in the discharging playa in Owens Valley or from the evaporation of steam at land surface in the geothermal areas. The trilinear water-analysis diagram (fig. 2) compares the dissolved-solids concentration in water from individual wells by the variation in size of the circles representing the wells. The larger the circle, the higher the dissolved-solids concentration.

The geothermal areas at Coso Hot Springs, Devils Kitchen, and Nicol indicate that the shallow water at land surface has a very low (acidic) pH, generally ranging from 1.5 to 4.5. This low pH is generally caused by the exposure of hydrogen sulfide (H_2S) in the steam to the air, which supports oxidation and produces sulfuric acid (H_2SO_4). This process is described by Barnes (1972, p. 571).

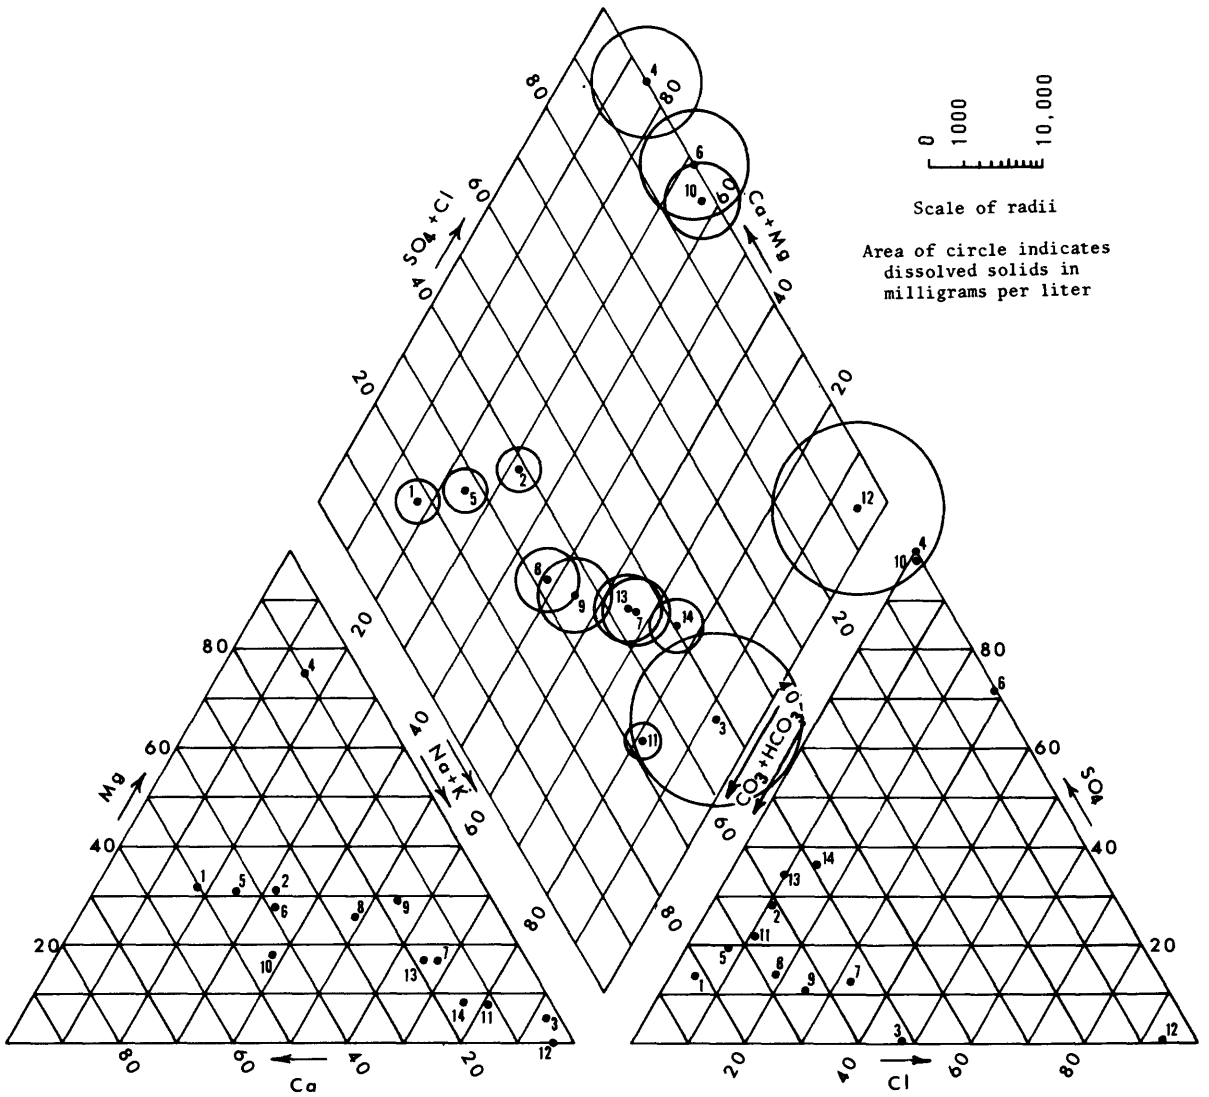
Because of the low pH of the shallow water, the water is commonly high in aluminum (Al^{+++}), magnesium (Mg^{++}), and hydrogen ions (H^+), and in silica (SiO_2). These constituents are seldom found in large quantities except in geothermal water having a pH less than 4.5. Because these constituents are not normally used in trilinear water-analysis diagrams, the percentage reacting values shown in figure 2 do not include them.

Medium-depth wells, 50-100 ft, have a neutral pH (7) and a low concentration of dissolved solids that may be caused by lateral inflow of fresh water at Coso Hot Springs.

The deep well (375 ft) at Coso Hot Springs has water that is basic (pH greater than 7). Water from this well is high in dissolved solids and in arsenic (As). An analysis of water shows 7.5 mg/L (milligrams per liter) of arsenic, which is above the 0.1 mg/L maximum recommended for drinking water by the U.S. Environmental Protection Agency (1972).

SURFACE-WATER BASIN BOUNDARIES

The surface-water basin boundaries on plate 1 show the four general subdivisions of the area. These subdivisions are based on water that flows to the Pacific Ocean, to Panamint Valley, to Searles Valley, and to 15 small areas that have internal drainage.



No. in figure	State well or spring No.	Date	Dissolved solids	Area
1	22S/37E-3NS1	7-15-55	310	Rose Valley
2	21S/39E-10PS1	12-14-60	317	Coso Valley
3	18S/37E-34A1	11-17-54	5,530	Owens Valley
4	22S/39E-7HS1	12-14-60	2,256	Devils Kitchen
5	22S/37E-2R2	10-26-61	380	Rose Valley
6	22S/39E-4K5	5-23-61	2,060	Coso Valley
7	23S/38E-5N1	5-11-60	894	Rose Valley
8	23S/38E-8D1	5-15-55	700	Rose Valley
9	23S/38E-17D1	10-22-59	1,307	Rose Valley
10	22S/39E-4K2	12-14-60	1,027	Coso Valley
11	22S/39E-4P1	5-07-62	293	Coso Valley
12	22S/39E-4H8	8-07-67	5,744	Coso Valley
13	21S/37E-2K1	1975	Σ = 878	Rose Valley
14	21S/37E-11C1	7-17-68	546	Rose Valley

Σ = Sum of constituents instead of dissolved solids on evaporation.

FIGURE 2.--Trilinear water-analysis diagram.

The surface-water basin boundary along the west edge of the study area corresponds to the Inyo-Tulare County line and separates surface water that flows toward the Pacific Ocean from that which flows through the Lahontan drainage province.

The basin boundary in the eastern part of plate 1 separates surface water that flows eastward into Panamint Valley from that which flows into Searles Valley.

The 15 small isolated surface-water basins near the center of plate 1 seem to be closely associated with the formation of the rhyolite domes. These domes were described by Duffield and Bacon (1976); two are labeled Sugarloaf Mountain and Cactus Peak on plate 1. These small basins surround the rhyolite domes and may have been formed by subsidence because of the extrusion of the domes. These basins all have internal drainage with a small playa at the lowest altitude. All precipitation within each basin flows toward the individual playa. As water flows toward the playa, some may enter the ground, but if it reaches the playa the water evaporates from the playa surface.

SUMMARY AND CONCLUSIONS

Temperature measurements made in the study area range from near freezing (4°C or 39°F) in a mountain spring to above boiling (142°C or 288°F) at the bottom of the deepest well. The temperature gradients below land surface range from 1.1°C (2°F) per 100 ft in nonthermal areas to 24.4°C (44°F) per 100 ft in thermal areas. Only six areas were found to have water or ground temperatures greatly above the local average air temperature: Coso Hot Springs, Devils Kitchen, Nicol area, Wheeler Prospect, and areas on the west and northeast sides of Sugarloaf Mountain.

The water quality is considered good throughout the study area except where water is evaporated from discharging playa surfaces or from steaming ground.

All temperatures measured in springs surrounding Coso Hot Springs and Devils Kitchen indicate that the springs are nonthermal and are strongly influenced by the ambient air temperature. One spring measured twice showed a variation of 21°C (38°F) between summer and winter.

SELECTED REFERENCES

The following references contain information on hydrology, geology, geophysics, mineralogy, geothermal conditions, surveying measurements and bench marks, paleontology, remote sensing, age dating of rocks, water-quality standards, measuring techniques, topography, or geography at or near Coso Hot Springs. Most of the hydrologic data in these references have been stored in the computer, whereas the other types of data have not been used. The references have been included only to help other investigators in search of information related to geothermal resources at or near Coso Hot Springs.

EXPLANATION OF WELL-RECORD TABLE

[Boxhead explanations are abstracted and modified from U.S. Geological Survey "Instructions for Using the Punch-Card System for the Storage and Retrieval of Ground-Water Data"]

State number: The wells are identified according to their location in the rectangular system for the subdivision of public land. The identification consists of the township number, north or south; the range number, east or west; and the section number. The section is further subdivided into sixteen 40-acre tracts lettered consecutively (excepting I and O), beginning with A in the northeast corner of the section and progressing in a sinusoidal manner to R in the southeast corner. Wells within the 40-acre tract are numbered sequentially. The base line and meridian are indicated by the final letter, as follows: H, Humboldt; M, Mount Diablo; S, San Bernardino.

Owner or name: The apparent owner or user. In some cases, the local name of the well is given.

Inventory date: The year the well was field canvassed; other information given generally applies for this date.

Method drilled:

- A Rotary
- B Bored or augered
- C Cable-tool
- D Dug
- H Hydraulic-rotary
- J Jetted
- P Air percussion
- R Reverse-rotary
- T Trenching
- V Driven
- W Drive-wash
- Z Other.

Depth of well: Depth, in feet below land-surface datum, is defined as the bottom of the perforated or screened interval or the bottom of the uncased part of the well.

Depth cased: Length of casing, in feet below land-surface datum, or to the top of the perforated or screened interval.

Well finish:

- C Porous concrete
- F Gravel wall, perforated or slotted casing
- G Gravel wall, commercial screen
- H Horizontal gallery or collector
- O Open end
- P Perforated or slotted casing
- S Screen
- T Sand point
- W Walled or shored
- X Open hole in aquifer (generally cased to aquifer)
- Z Other.

Diameter: Inside diameter of the well, in inches; nominal inside diameter, in inches, of the innermost casing at the surface for drilled cased wells.

Power:

- 1 Hand
- 2 Natural gas engine
  - A 0-20 hp
  - B >20-50
  - C >50-100
  - D >100-200
  - E >200
- 3 Gasoline engine
  - F 0-5 hp
  - G >5-20
  - H >20-50
  - J >50-100
  - K >100-200
  - L >200
- 4 Diesel engine
  - M 0-50 hp
  - N >50-150
  - P >150-400
  - Q >400-750
  - R >750
- 5 Electric motor
  - S 0-1 hp
  - T >1-5
  - U >5-15
  - V >15-100
  - W >100
- 6 Wind
- 7 LP gas engine (propane or butane)
  - A 0-20 hp
  - B >20-50
  - C >50-100
  - D >100-200
  - E >200
- 8 Other.

Lift method:

- A Air
- B Bucket
- C Centrifugal
- J Jet
- L Multiple (centrifugal)
- M Multiple (turbine)
- N None
- P Piston
- R Rotary
- S Submergible
- T Turbine
- Z Other.

Water use:

- A Air conditioning
- B Bottling
- C Commercial
- D Dewatering
- E Power generation
- F Fire protection
- H Domestic
- I Irrigation
- M Medicinal
- N Industrial, including mining
- P Public supply
- R Recreation
- S Stock supply
- T Institutional
- U Unused
- V Repressurization
- W Recharge
- X Desalination, public supply
- Y Desalination, other use
- Z Other.

Well use:

- A Anode
- D Drainage
- G Seismic hole
- H Heat reservoir
- O Observation
- P Oil or gas
- R Recharge
- T Test hole
- U Unused
- W Withdraw water
- X Waste disposal
- Z Destroyed.

Altitude of lsd: Altitude of land-surface datum, in feet, above or below (-) mean sea level. Land-surface datum is an arbitrary plane closely approximating land surface at the time of the first measurement and used as the plane of reference for all subsequent measurements.

Number of water level: 0 Indicates one measurement; I indicates more than one measurement.

Chemical analyses:

- C Indicates one analysis in which the major chemical constituents were determined in order to permit an anion-cation equation balance
- M Indicates more than one analysis
- P Indicates one analysis in which a few selected constituents and properties were determined.

Pumping data:

- P Indicates pumping data available.

Log data: Restricted information. Availability to public dependent upon requester securing owner's permission.

- A Drilling-time
- B Casing-collar
- C Caliper (diameter) survey
- D Driller's
- E Electric
- F Fluid-conductivity or fluid-resistivity
- G Geologist or sample
- H Magnetic
- I Induction
- J Gamma-ray
- K Dipmeter or directional (inclinometer) survey
- L Laterolog
- M Microlog
- N Neutron
- O Microlaterolog
- P Photographic
- Q Radioactive-tracer
- R Radiation (includes both neutron and gamma-ray)
- S Sonic
- T Temperature
- U Temperature and fluid-conductivity (resistivity)
- V Fluid-velocity
- W Electric and radiation
- X Electric, radiation, caliper, and fluid-velocity
- Y Electric, radiation, and sample (or driller's)
- Z Electric, radiation, temperature, and fluid-conductivity
- 8 Miscellaneous (other combinations).

TABLE 2.--*Description of springs*

Discharge: F Flowing.

Water use: H Domestic; P Public supply; S Stock supply; U Unused; Z Other (Wildlife, etc.)

Altitude of lsd: Altitude of land-surface datum, in feet, above mean sea level. Land-surface datum is an arbitrary plane closely approximating land surface.

Method measured: 0 Estimated; 1 Bucket; R Reported.

Improvements: 0 None; 1 Trough.

Chemical analyses: P Indicates one analysis in which a few selected constituents and properties were determined; M Indicates more than one analysis.

State number	Owner or local name of spring	Date discharge measured	Discharge (gal/min)	Method measured	Water use	Improve-ments	Chemical analyses	Altitude of lsd (ft)

TABLE 3.--*Records of water level*

Letter(s) following water-level measurements:

A Well being pumped.
B Well pumped recently.
C Nearby well being pumped.
D Nearby well pumped recently.
E Estimated.
F Dry.
G Measurement by another agency.
H Tape measurement (recorder).
I Affected by atmospheric pressure.
J Water level below sea level.
K Measurement from recorder chart.
M Obstruction in well above water surface.
N No measurement.
O Discontinued.
P Destroyed.
Q Flowing.

18S/37E-34A1 M. DEPTH 600 FT IN 1917.
LSD 3590 FT ABOVE MSL.
HIGHEST WATER LEVEL 0.67 ABOVE LSD, MAR. 10, 1976,
LOWEST WATER LEVEL 0.67 ABOVE LSD, MAR. 10, 1976.
RECORDS AVAILABLE: 1976.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
MAR. 10, 1976 +	.67						

19S/37E-33N1 M. DEPTH 1.2 FT IN 1975.
LSD 3740 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, NOV. 6, 1975.
RECORDS AVAILABLE: 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
NOV. 6, 1975	F						

19S/39E-27K1 M. DEPTH 5 FT IN 1975.
LSD 5960 FT ABOVE MSL.
HIGHEST WATER LEVEL 4.00 BELOW LSD, OCT. 9, 1975,
LOWEST WATER LEVEL 4.00 BELOW LSD, OCT. 9, 1975.
RECORDS AVAILABLE: 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
OCT. 9, 1975	4. E						

19S/40E-34D1 M. DEPTH 3.5 FT IN 1975.
LSD 5150 FT ABOVE MSL.
HIGHEST WATER LEVEL 2.17 BELOW LSD, OCT. 9, 1975,
LOWEST WATER LEVEL 2.17 BELOW LSD, OCT. 9, 1975.
RECORDS AVAILABLE: 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
OCT. 9, 1975	2.17						

20S/37E-3D1 M. DEPTH 65 FT WHEN DRILLED, 63.4 FT IN 1975.
LSD 3748.51 FT ABOVE MSL.
HIGHEST WATER LEVEL 17.45 BELOW LSD, NOV. 12, 1975,
LOWEST WATER LEVEL 17.45 BELOW LSD, NOV. 12, 1975.
RECORDS AVAILABLE: 1975.

TABLE 3.--*Records of water level*--Continued

22S/39E-4A7 M. WELL PRODUCING STEAM AT LAND SURFACE. DEPTH 3.1 FT IN 1975.
LSD 3640 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, AUG. 13, 1975.
RECORDS AVAILABLE: 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
AUG. 13, 1975	F						

22S/39E-4A10 M. WELL PRODUCING STEAM AT LAND SURFACE.
LSD 3640 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, AUG. 13, 1975.
RECORDS AVAILABLE: 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
AUG. 13, 1975	F						

22S/39E-4A12 M. WELL PRODUCING STEAM. CASING FILLED WITH SCALE 2.4 FT ABOVE LAND SURFACE IN 1975.
LSD 3640 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, AUG. 13, 1975.
RECORDS AVAILABLE: 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
AUG. 13, 1975	F						

22S/39E-4A13 M. WELL PRODUCING STEAM AT LAND SURFACE.
LSD 3625 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, AUG. 13, 1975.
RECORDS AVAILABLE: 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
AUG. 13, 1975	F						

22S/39E-4A14 M. WELL PRODUCING STEAM AT LAND SURFACE.
LSD 3625 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, AUG. 13, 1975.
RECORDS AVAILABLE: 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
AUG. 13, 1975	F						

22S/39E-4A15 M. WELL PRODUCING STEAM AT LAND SURFACE. DEPTH 2.0 FT IN 1975.
LSD 3625 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, AUG. 13, 1975.
RECORDS AVAILABLE: 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
AUG. 13, 1975	F						

22S/39E-4A16 M. WELL PRODUCING STEAM AT LAND SURFACE. DEPTH 3.85 FT IN 1975.
LSD 3625 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, AUG. 13, 1975.
RECORDS AVAILABLE: 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
AUG. 13, 1975	F						

22S/39E-4A17 M. WELL PRODUCING STEAM AT LAND SURFACE.
LSD 3625 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, AUG. 13, 1975.
RECORDS AVAILABLE: 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
AUG. 13, 1975	F						

22S/39E-4H1 M. WELL PRODUCING STEAM AT LAND SURFACE. DEPTH 20.4 FT IN 1961.
LSD 3615 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, JAN. 11, 1961, AUG. 13, 1975.
RECORDS AVAILABLE: 1961, 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
JAN. 11, 1961	F	AUG. 13, 1975	F				

22S/39E-4H2 M. WELL PRODUCING STEAM AT LAND SURFACE. DEPTH 36.0 FT IN 1961.
LSD 3615 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, JAN. 11, 1961, AUG. 13, 1975.
RECORDS AVAILABLE: 1961, 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
JAN. 11, 1961	F	AUG. 13, 1975	F				

22S/39E-4H3 M. WELL PRODUCING STEAM AT LAND SURFACE.
LSD 3615 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, JAN. 11, 1961, AUG. 13, 1975.
RECORDS AVAILABLE: 1961, 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
JAN. 11, 1961	F	AUG. 13, 1975	F				

22S/39E-4H4 M. WELL PRODUCING STEAM AT LAND SURFACE.
LSD 3615 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, JAN. 11, 1961, AUG. 13, 1975.
RECORDS AVAILABLE: 1961, 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
JAN. 11, 1961	F	AUG. 13, 1975	F				

22S/39E-4M5 M. STEAM COMING OUT OF DIRT WHERE WELL WAS LOCATED.
LSD 3610 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, JAN. 11, 1961.
RECORDS AVAILABLE: 1961, 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
JAN. 11, 1961	F	JULY 29, 1975	P				

22S/39E-4M6 M. WELL FILLED WITH CEMENT AT LAND SURFACE. STEAM COMING UP AROUND CASING. DEPTH 30 FT WHEN DRILLED.
LSD 3610 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, JAN. 11, 1961.
RECORDS AVAILABLE: 1961, 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
JAN. 11, 1961	F	JULY 29, 1975	P				

22S/39E-4M7 M. WELL PRODUCING STEAM AT LAND SURFACE. DEPTH 24.62 FT IN 1961.
LSD 3600 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, AUG. 23, 1961, AUG. 13, 1975.
RECORDS AVAILABLE: 1961, 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
AUG. 23, 1961	F	AUG. 13, 1975	F				

22S/39E-4M8 M. PERFORATED 320-370 FT; OPEN END AT 375 FT.
LSD 3615 FT ABOVE MSL.
HIGHEST WATER LEVEL 103.60 BELOW LSD, DEC. 18, 1967,
LOWEST WATER LEVEL 152.00 BELOW LSD, MAR. 23, 1967.
RECORDS AVAILABLE: 1967, 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
MAR. 23, 1967	152. G	DEC. 18, 1967	103.6 G	AUG. 13, 1975	-N		

22S/39E-4J1 M. DEPTH 1.9 FT IN 1961, 1.3 FT IN 1975.
LSD 3600 FT ABOVE MSL.
DRY, WATER LEVEL NOT MEASUREABLE, MAY 23, 1961, AUG. 13, 1975.
RECORDS AVAILABLE: 1961, 1975.

DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL	DATE	WATER LEVEL
MAY 23, 1961	F	AUG. 13, 1975	F				

TABLE 3.--*Records of water level*--Continued

22S/39E-4K1 M. DEPTH 86.7 FT IN 1960, 86.7 FT IN 1975.
LSD 3660 FT ABOVE MSL.
HIGHEST WATER LEVEL 55.60 BELOW LSD, AUG. 12, 1965,
LOWEST WATER LEVEL 63.60 BELOW LSD, JULY 20, 1962.
RECORDS AVAILABLE: 1960-65, 1975-76.

EXPLANATION OF CHEMICAL-ANALYSIS TABLE

Any column:

MO Trace is present, and quantity rounds to 0 in whole numbers

M.0 Trace is present, and quantity rounds to tenths of a whole number

M.00 Trace is present, and quantity rounds to hundredths of a whole number

Code for agency collecting sample
and
Code for agency analyzing sample:

704 Navy

1028 Geological Survey

9801 Private laboratory

TABLE 6.--*Well hydraulics*

Time: Time of measurement, in minutes, after pump was started.

Static water level: Depth to water, in feet below or above (+) land-surface datum, prior to start of test.

Pumping water level: Depth to water, in feet below or above (+) land-surface datum, at end of test. Q means flowing above land surface.

Drawdown: Difference, in feet, between the static and pumping water levels.

Yield: Yield of the well, in gallons per minute, for drawdown indicated.

Specific capacity: Yield, in gallons per minute per foot of drawdown. In a fully efficient and fully penetrating well, specific capacity directly reflects aquifer transmissivity. A declining specific capacity, with time, indicates deteriorating well condition. An increasing specific capacity indicates continuing development of the aquifer near the well. For a given amount of available drawdown, a well with a large specific capacity will have a greater yield than a well with a small specific capacity.

STATE NUMBER	DATE	TIME (MIN)	STATIC WATER LEVEL (FT)	PUMPING WATER LEVEL (FT)	DRAW-DOWN (FT)	YIELD (GPM)	SPECIFIC CAPACITY (GPM/FT OF DD)
