PRINCIPAL FACTS FOR GRAVITY STATIONS IN CENTRAL NEVADA,
NYE, ESMERALDA, LANDER, EUREKA, AND
WHITE PINE COUNTIES, NEVADA

The gravity data reported herein are a compilation of gravity stations established (1966 to 1970) by field crews of the U.S. Geological Survey. The majority of these data are located within the area of Nevada bounded by U.S. Highways 6 and 50 and Nevada highways 8A and 20 (fig. 1). This work was sponsored by the Nevada Operations Office of the U.S. Atomic Energy Commission (now the Energy Research and Development Administration).

Unpublished data (principally along the highways) by D. R. Mabey are included. Some published data (Mabey, 1964) that have subsequently been terrain corrected are also included.

These data were reduced using standard reduction procedures and established computer programs. The standard reduction density of 2.67 Mg/m^3 was used and the second density was arbitrarily assumed to be 2.20 Mg/m^3 . Many gravity stations were located where elevations were shown on the available topographic maps, others were established by planetable surveys or by field crews from the U.S. Geological Survey. The latitude and longitude values were either scaled from these maps or established by the surveying. Terrain corrections through zone L (Hammer, 1939) were either computed or estimated from adjacent values for each station. The total terrain corrections were determined to a radial distance of 166.7 km by the Plouff (1966) computer program. This program utilizes two sets of maps on which the topography is digitized in 1 X 1 minute and 3 X 3 minutes of latitude and longitude. The accuracy of the data herein reported, based on estimates of possible errors in the observed gravity, longitude, elevation, and terrain correction, is thought to be $\pm 0.4 \text{ mGals}$ in the valley areas. In the elevated ranges, where the terrain correction errors may be larger, the data may be in error by 1 mGal or more.

The principal gravity reference base station for this survey was Woollard's (1958, p. 533) base at the Tonopah Airport. Woollard's published value for this base was 979,476.4 mGals and this value was used throughout the survey. After the majority of the fieldwork was completed the Department of the Air Force established a better defined base station (Tonopah J) at the Tonopah Airport. The value for Tonopah J was 979,476.15 mGal (Department of the Air Force, written commun., 1969). A direct tie between these bases indicated a difference of 0.27 mGal and verifies Woollard's published value.

Additional base stations were established as needed around the area. The principal bases used are listed in the appendix.

These data have not been converted to the 1971 IGSN (International Gravity Standardization Network). However, such a conversion could be accomplished by subtracting -14.38 mGals from the observed gravity values included herein (Defense Mapping Agency, written commun., 1974) and recomputing, using the 1967 International Gravity formula (International Association of Geodesy, 1971, p. 60).

The principal facts for the gravity data, herein reported, are listed in table 1. The abbreviations of the column headings on each page of table 1 are explained below. The appendix includes descriptive data for the principal gravity base stations used for this survey. These data are self explanatory with the possible exception of the line labeled SBA. SBA is the abbreviation for Simple Bouguer anomaly and is equivalent to S.B.1 as described below.
