# GROUND-WATER LEVELS IN WYOMING, 1976

by

Wilbur C. Ballance and Pamela B. Freudenthal

## ABSTRACT

Ground-water levels are measured periodically in a network of about 280 observation wells in Wyoming to record changes in ground-water storage. The areas of water-level observation are mostly where ground water is used in large quantities for irrigation or municipal purposes. This report contains maps showing location of observation wells and water-level changes from 1976 to 1977. Well history, highest and lowest water levels, and hydrographs for most wells are also included in this report.

The program of ground-water observation is conducted by the U. S. Geological Survey in cooperation with the Wyoming State Engineer and the city of Cheyenne.

## INTRODUCTION

Ground-water levels are measured periodically in a network of observation wells in Wyoming, principally in areas where ground water is used for irrigation or municipal purposes. The water levels are measured annually, usually in January, February, or March. However, sometimes weather conditions prevent reaching some wells until April. The time selected for measuring is when recovery of water levels from pumping effects of the previous irrigation season is virtually complete. These water-level measurements indicate changes in ground-water storage when compared with previous measurements.

Water levels measured in about 240 wells during the first 4 months of 1977 were compared with measurements made during the same period in 1976 to give the net change in water levels for this period. These net changes along with depth to water in 1977 are shown in tables and on maps. Water levels were measured periodically in about 280 wells for a total of about 1,100 measurements in 1976. Twenty-one wells were equipped with water-stage recorders in 1976. Hydrographs of most wells in the observation-well network were made using periodic measurements and the highest water levels recorded for the first and fifteenth day of each month for those wells equipped with water-stage recorders.

Four previous reports of ground-water levels in Wyoming were compiled by the U. S. Geological Survey (Ringen, 1973; Ringen, 1974; Ballance and Freudenthal, 1975; and Ballance and Freudenthal, 1976).

## PRESENTATION OF DATA

The data in this report are presented alphabetically by counties (fig. 1). Records of observation wells for each county are listed in a table, preceded by a map of each county (figs. 2-21) showing the location of the wells, water-level change 1976-77, and the depth to water below land surface in 1977. Because of the large number of wells measured in the Cheyenne well field, only locations for selected wells are shown on the map of western Laramie County.

In addition to the annual measurements, selected wells are measured periodically, generally at 2- to 4-month intervals, in order to show seasonal changes in water levels caused by precipitation and pumping. Following the table of annual measurements for each county are hydrographs for most wells for the 9-year period 1969-77, or for the period of record if less than 9 years.

All water-level measurements tabulated in this report are in feet below land-surface datum, unless otherwise indicated. A plus sign (+) is used to indicate water level above land-surface datum.

### Use of Metric Units

The International System (SI) of units is being adopted for use in reports prepared by the Geological Survey. To assist readers of this report in understanding and becoming accustomed to the metric system, the English units used in this report may be converted to metric (SI) units by use of the following factors:

<u>Multiply English units</u>	<u>by</u>	<u>To obtain metric (SI) units</u>
acres	0.4047	square hectometers
feet	.3048	meters

### Well-Numbering System

The system of numbering wells in Wyoming is based on the common subdivision of public lands into sections. The 40th Parallel Base Line and the Sixth Principal Meridian are used as a reference for most of Wyoming. Land subdivisions in Wyoming referenced to that base line and meridian are north and west of the point of origin; therefore, north and west are not specified in the designation for well numbers. The well number, in addition to designating the well, locates its position to the nearest 10-acre tract in the land network. The first segment of the number denotes the township north of the 40th Parallel Base Line, the second segment denotes the range west of the Sixth Principal Meridian, and the third segment denotes the section. The fourth segment of the number, consisting of one to three lower case letters, denotes the 160-acre, 40-acre, and 10-acre tracts, respectively, in which the well is situated. For this purpose, the section is divided into four quarters, a, b, c, and d, reading in a counterclockwise direction, for the northeast, northwest, southwest, and southeast quarters,

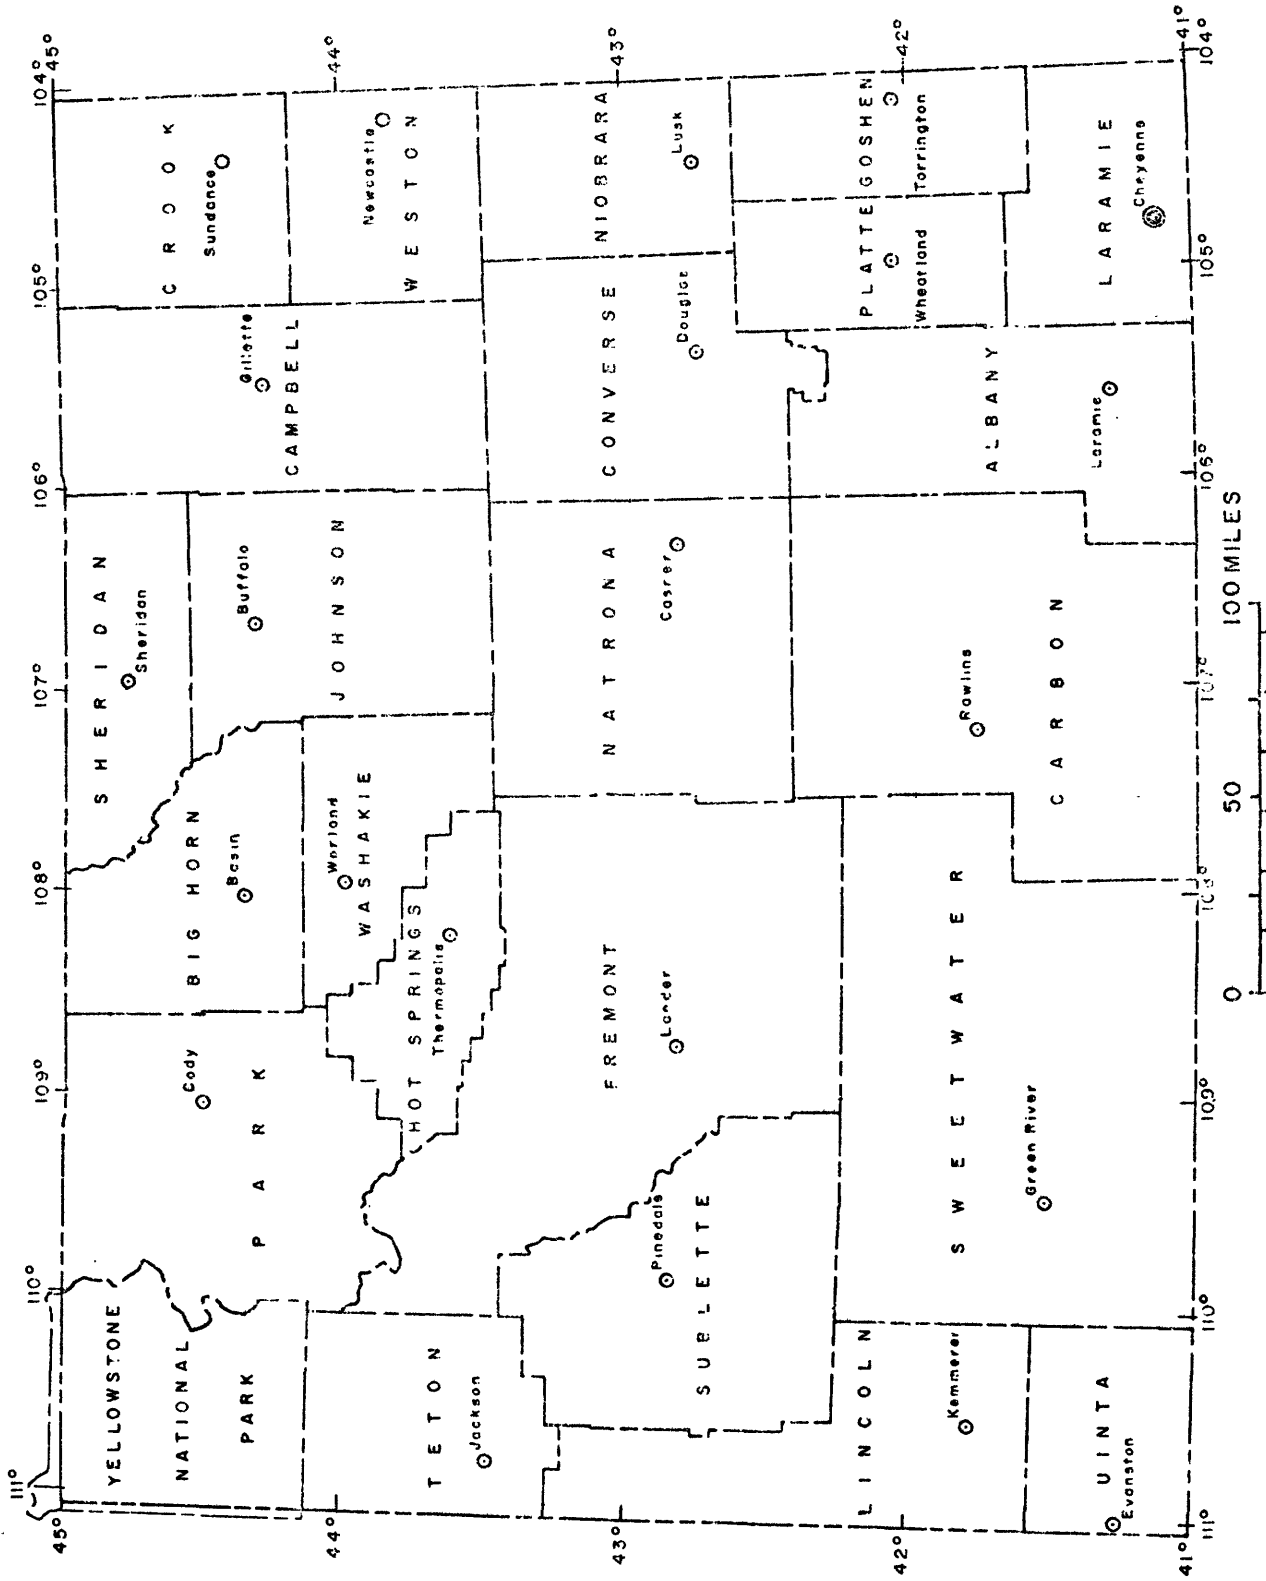

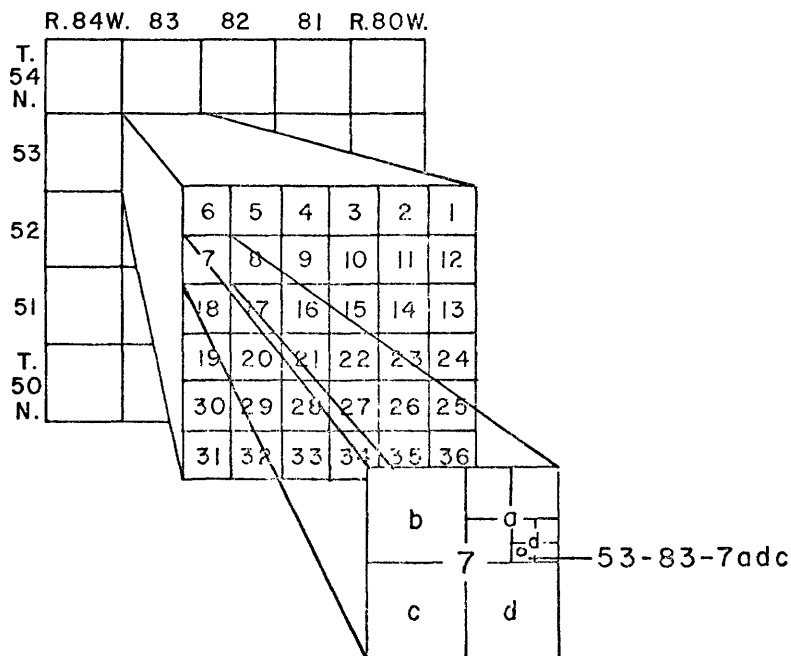

Figure 1.--Counties of Wyoming.

respectively. The first letter of the fourth segment gives the quarter section, which is a tract of 160 acres. Similarly, the quarter section is divided into four 40-acre tracts lettered in the same manner, and the second letter, if present, denotes the 40-acre tract. Finally, the 40-acre tract is divided into four 10-acre tracts, and the third letter, if present, denotes the 10-acre tract. If there is more than one well in the 10-acre tract, a numeral is added after the fourth segment to show that it is one of several wells assigned a number in that 10-acre tract.

An example of translating a well location into a well number is shown in the following illustration of well 53-83-7adc, in Sheridan County, SW $\frac{1}{4}$  SE $\frac{1}{4}$  NE $\frac{1}{4}$  sec. 7, T. 53, R. 83.

Observation wells on the Wind River Indian Reservation in Fremont County are similarly located; however, they are in a land subdivision that is referenced to the Wind River Base Line and Meridian, as used by Morris and others (1959). Wells within this system may be in the northeast, northwest, southwest, or southeast quadrants of this base-line and meridian net. Well numbers in this land net have the upper-case-letter prefixes A, B, C, or D to designate the northeast, northwest, southwest, or southeast quadrants, respectively.

Explanatory Information

Well number: See page 2 for a description of the well-numbering system.

Well depth: Depth of well, in feet, below land surface.

Use of water: H, domestic; I, irrigation; p, municipal; S, stock; N, industrial; U, unused.

Geologic source:

111ALVM	Alluvium deposits	211LNCE	Lance Formation
111TRRC	Terrace deposits	211MVRD	Mesaverde Formation or Group
121NRPK	North Park Formation		
121ØGLL	Ogallala Formation	211STEL	Steele Shale
122ARKR	Arikaree Formation	217LKØT	Lakota Formation
123BRUL	Brule Formation	221SNDC	Sundance Formation
123WRVR	White River Formation or Group	237SPRF	Spearfish Formation
		317CSPR	Casper Formation

124WDRV	Wind River Formation	317MNKT	Minnekahta Formation
124WSTC	Wasatch Formation	331MDSN	Madison Limestone
125FRUN	Fort Union Formation	337PHSP	Pahasapa Limestone
211ALMD	Almond Formation	374FLTD	Flathead Quartzite or Sandstone
211FXHL	Fox Hills Sandstone		

Records available: Years for which water-level measurements are available.

Water levels: January, February, March, or April water-level measurement and change since last year. A plus sign (+) is used to indicate a water-level rise since the measurement last year. A minus sign (-) is used to indicate a water-level decline since the measurement last year.

Highest and lowest: The highest and lowest water levels of record. The lowest recorded level as indicated for a well is a static, or non-pumping level, as far as could be determined.

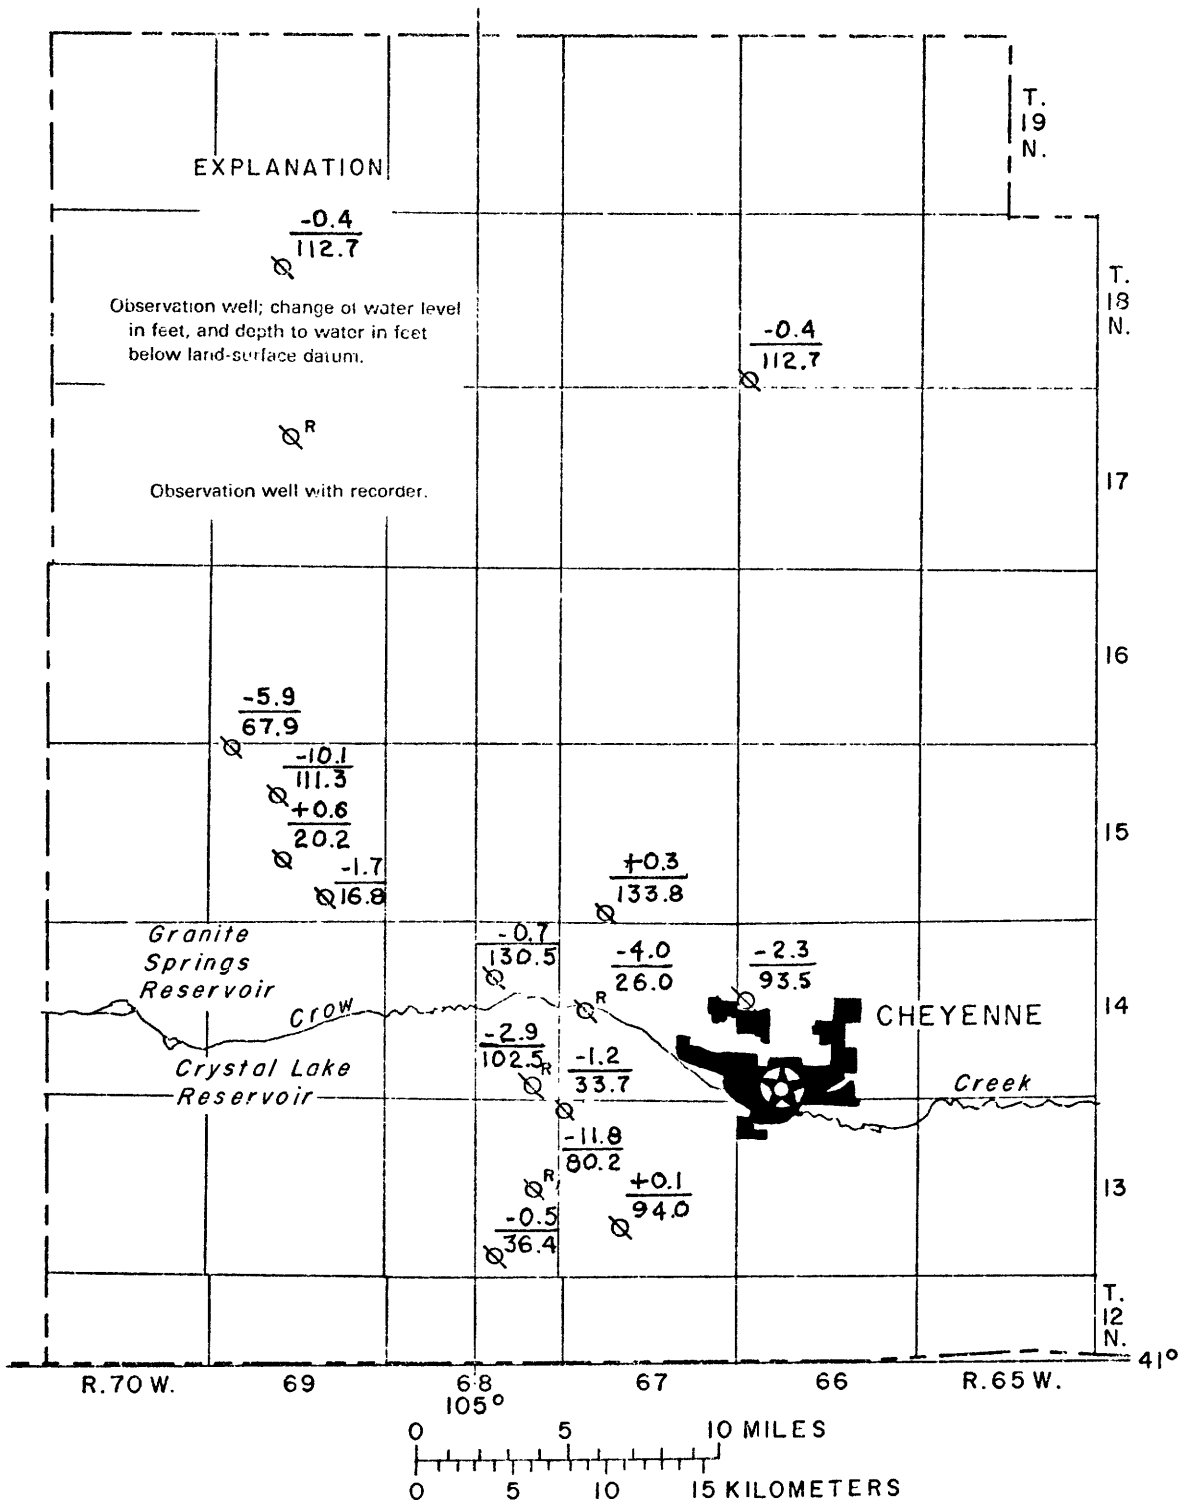

Figure 12.--Locations of observation wells, change of ground-water level from March or April 1976 to March 1977, and depth to ground-water level in March 1977 in western Laramie County, Wyoming.

Water levels in western Laramie County, Wyoming; March 1977; change in water level, in feet, from March or April 1976 to March 1977; and highest and lowest recorded water levels, in feet below land surface datum.
