Analyses of rock samples from Ketchikan quadrangle, southeastern Alaska

by

R. D. Koch and R. L. Elliott

Introduction

A reconnaissance geochemical sampling program was conducted between 1975 and 1977 in the Ketchikan and Prince Rupert 1:250,000-scale quadrangles, southeastern Alaska. This study was done to assist in a mineral resource evaluation of the area as part of the Alaska Mineral Resource Assessment Program (AMRAP). This report contains the analytical data for 1,591 rock samples collected in the Ketchikan quadrangle during this and previous U.S. Geological Survey mapping projects between 1968 and 1977. These samples comprise all of the normal rock geochemical samples collected during the U.S. Geological Survey geological mapping investigations within the Ketchikan quadrangle through 1977. A brief statistical summary of the analytical data is included in this report.

Analytical data from stream-sediment geochemical sampling within the Ketchikan quadrangle and from all geochemical sampling in the Prince Rupert quadrangle directly south of the Ketchikan quadrangle, are contained in two companion reports (Koch and Elliott, 1978a, 1978b). Geochemical data from the southern portion of the Bradfield Canal quadrangle (directly north of the Ketchikan quadrangle) are reported in Koch and others (1976a). Analytical data from rock samples collected by U.S. Bureau of Mines' engineers during the Granite Fiords Wilderness

Study (Berg and others, 1977a) were included in a previous work (Koch and others, 1976b). Data from all of the normal U.S. Geological Survey rock and stream-sediment geochemical samples collected in the Ketchikan and Prince Rupert quadrangles are available on magnetic computer tape (Koch, Van Trump, and McDanal, 1978).

Geologic studies in the Ketchikan area

The western half of the Ketchikan quadrangle is underlain by a broad belt of regionally metamorphosed Paleozoic and Mesozoic sedimentary and volcanic rocks which grade from greenschist to amphibolite facies. These rocks are intruded by numerous granitic stocks of Cretaceous to Miocene age. Granitic and amphibolite-grade regionally metamorphosed rocks of the Coast Range metamorphic-plutonic complex occur throughout the eastern and northern portions of the quadrangle.

The earliest comprehensive discussions of the geology of the Ketchikan area are contained in reports by Wright and Wright (1908) and Buddington and Chapin (1929). Buddington (1929) also described the Hyder mining district located near the Canadian border 120 km northeast of Ketchikan. Other discussions of the geology of this area include a report by Hutchison (1970) on the Coast Range metamorphic-plutonic complex in the Prince Rupert region of British Columbia and a summary of the Coast Range metamorphic-plutonic complex by Roddick and Hutchison (1974).

Recent geologic investigations by the U.S. Geological Survey in the Ketchikan quadrangle began in 1966 with mapping on Annette Island (Berg, 1972). Mapping began on Gravina Island in 1967 (Berg, 1973; Berg, Jones,

and Richter, 1972) and in the Hyder area in 1968 (Smith, 1977). Reconnaissance mapping in the Nakat Bay-Boca de Quadra area was carried out in 1969 and 1970 (Smith, 1973). A mineral resource evaluation of the Granite Fiords Wilderness Study area east of east Behm Canal was conducted in 1972 and 1973 (Berg and others, 1977a). Field studies continued as part of the AMRAP program from 1975 to 1977 (Berg, Elliott, and Koch, 1976; Elliott, Smith, and Hudson, 1976; Berg and others, 1977b). Reconnaissance mapping of the Ketchikan and Prince Rupert quadrangles has been completed and a geologic map at a scale of 1:250,000 has been published (Berg and others, 1978).

Sampling

Standard procedures were followed in collection, preparation, and analysis of rock geochemical samples. The samples are primarily grab samples chosen to provide data on background values for a lithologic unit. The majority of these samples are representative of the dominant lithologies at the sample site. A lesser number of samples were collected from minor lithologies, known mineralized occurrences, or outcrops that are conspicuously iron-stained or contain visible metallic minerals.

Sample preparation and analytical procedures

Samples were crushed, a split was pulverized and a split of this material analyzed. Analyses were performed by the Branch of Exploration Research of the U.S. Geological Survey for up to 30 elements by the six-step semiquantitative emission spectrographic method (Grimes and Marranzino, 1968), and for gold, copper, lead and zinc by atomic

absorption spectrophotometry (Ward and others, 1969). Samples collected in 1972 and 1973 were analyzed for mercury by a flameless atomic absorption mercury-vapor detection technique (Vaughn and McCarthy, 1964). Some analyses were not performed on all samples. The semiquantitative spectrographic analyses were performed by J. E. Abrams, E. F. Cooley, K. J. Curry, G. W. Day, C. L. Forn, R. T. Hopkins, R. C. Karlson, J. W. McNamera, and D. F. Siems. The atomic absorption analyses were done by R. B. Carten, J. A. Criswell, D. E. Detra, J. D. Hoffman, R. W. Leinz, A. L. Meier, R. L. Miller, D. G. Murrey, R. M. O'Leary, J. A. Roybal, R. F. Sanzolone, A. J. Toevs, and W. W. Vaughn.

Geochemical data

Locations of rock sample sites are identified by station numbers on plate 1. The analytical data for the samples are given in table 6 and are identified by station number with a letter appended to the station number to distinguish different samples from the same station. Some samples were re-analyzed as part of a test of analytical variance. These sample numbers appear twice in table 6 along with data for both analyses.

Each sample has been assigned a rock type and is labeled in table 6 with a rock name code consisting of a two-letter rock-name symbol which may be followed by one or more two-letter mineral-modifier symbols. An explanation of these rock-name and mineral-modifier codes is listed in table 4 (p. 17).

Analytical Values

Analytical results are reported as percent of the sample (for spectrographic analyses of Fe, Mg, Ca, and Ti) and as parts per million (ppm) for all other analyses. The minimum limits of determination and the units used for each analysis are listed in table 1 (p. 6).

A single-letter symbol is used by USGS analysts to indicate that no analysis was performed for an element or that the analytical result is outside the limits of determinability. These symbols (commonly called "qualification codes") are used in the statistical summary but some are represented differently in the data table. An explanation of both forms is listed in table 2. The code T does not appear in these data.

Table 2.--Qualification codes.

Qualification code	Form in table 6	Explanation
B	--	No analytical data for this analysis.
N	N	Nothing detected by analysis.
L	<	Element detected but below listed value (lower limit of determinability).
G	>	Element detected in amount greater than listed value (upper limit of determinability).
H	(value = 0)	Interference - no valid data.
T		Trace

Because the original computer printout is used in the tables, element symbols are in capital letters; for example, the symbol for iron, Fe, is shown as FE, magnesium, Mg, is shown as MG, and so on. In the

Table 1. Lower determination limits and units for analyses performed from 1968 through 1977. S - indicates spectrographic analysis, AA - indicates atomic absorption analysis and INST - indicates flameless atomic absorption mercury-vapor analysis. The units used to report values for each analytical procedure are listed after the determination limit.

S-Fe--------- .05%	S-Cd---------20 ppm	S-Sr----------100 ppm
S-Mg--------- .02%	S-Co--------- 5 ppm	S-V---------- 10 ppm

[5/] .02 ppm prior to 1972.

[6/] .01 ppm prior to 1972.

tables, the prefix S stands for spectrographic analysis, AA for atomic absorption and INST for flameless atomic absorption mercury-vapor analysis.

Results from semiquantitative emission spectrographic analyses (also referred to as six-step spectrographic analyses) are reported as the midpoints of geometric class intervals. Midpoints of the class intervals and the associated class interval boundaries are listed in table 3. Reported values may be an integral power of 10 times one of the listed class interval midpoints.

Table 3. Class intervals of the six-step scale.

Class Interval Midpoint	Class Interval Limits	
1.0	0.83	1.2
1.5	1.2	1.8
2.0	1.8	2.6
3.0	2.6	3.8
5.0	3.8	5.6
7.0	5.6	8.3
10.0	8.3	12.0

Precision

Tests have been performed to determine the analytical precision of the six-step semiquantitative spectrographic technique used by the Branch of Exploration Research (Motooka and Grimes, 1976). These tests indicate that the frequency with which values from repeated analyses of the same sample will fall within the class interval containing the "true" value (as measured by the mean of a series of analytical runs),

plus or minus one and two adjoining intervals is approximately 83 percent and 96 percent, respectively. For example, if a value is reported as 3.0, the probability is .83 that a repeated analysis would be reported as 2.0, 3.0, or 5.0. This study found analytical variance to be consistent for a variety of geologic materials and to show no appreciable difference between elements or concentration ranges except near the limits of determinability. Another experiment (Johnson and others, 1977) suggests that analytical precision varies appreciably between elements. Analyses by the atomic absorption methods are not reported on the six-step scale; they are more sensitive and more precise than spectrographic analyses.

Statistical summary

The analytical data were processed by a computer program known as GEOSUM and the program's output is presented in table 5. For samples which have been re-analyzed, the values listed second in the data table have been arbitrarily omitted from the statistical summary to reduce bias. The GEOSUM program is designed to summarize and tabulate geochemical data--primarily from semiquantitative spectrographic analyses. All distributions are treated in terms of the six-step class intervals described above and thus the atomic absorption data are regrouped to fit into these intervals. The program output consists of: (a) a frequency distribution table, histogram, summary of qualified values, range of values and geometric mean and deviation for each element, and (b) a statistical summary for all elements, which includes geometric means and geometric deviations.

The histograms are on a logarithmic scale and are computed using the class intervals of the six-step semiquantitative scale. The histogram bars are composed of X's; each X represents approximately 1 percent of the total number of samples analyzed for that element. Decimal numbers are printed by the computer as powers of 10, for example:

7.0e-01	means	7.0×10^{-1}	or	0.7
7.0e+00	means	7.0×10^{0}	or	7.0
7.0e+01	means	7.0×10^{1}	or	70.0
7.0e+02	means	7.0×10^{2}	or	700.0

The frequency distribution tables, histograms, and statistics for each element were derived using only data values within the range of analytical determination which have been used since 1975. Between 1968 and 1975, the lower limits of determinability were raised for atomic absorption analysis of Au and Hg and for spectrographic analysis of Ti, Ba, Cr, and Nb. Unqualified values less than the current determinability limits and all values qualified with N, L, G, or H were ignored in these computations. The resulting frequency tables and statistics are biased and the histograms incomplete.

The summary at the end of table 5 shows which elements have qualified values, as well as the number of values having each type of qualification. The summary also presents a recomputed geometric and geometric deviation using a method devised by A. J. Cohen for treating censored distributions. If an element has no qualified data values, the mean and geometric deviation will be the same in both this summary and on the page within the table for the particular element. For elements with qualified data, the estimates of mean and geometric devia-

tion are unbiased in a strict sense only where the data are derived from a log-normal parent population, but experiments have shown that large departures from this requirement do not usually invalidate the results. Acceptance and use of the estimates, however, are the responsibility of the user.

The geometric mean is the antilogarithm of the arithmetic mean of the logarithms of the analyses. It is not an estimate of geochemical abundance but of "central tendency" (or characteristic value) for a frequency distribution that is approximately symmetrical on a logarithmic scale. The geometric mean is useful for characterizing many geochemical distributions. The geometric deviation is the antilogarithm of the standard deviation of the logarithms of the analyses.

For further discussion of geometric mean and geometric deviation and of Cohen's method for censored distributions, see Miesch (1963, 1967).

Bias and variability affecting interpretation

In reviewing the data in table 6 and the statistical summary in table 5, several sources of bias and variability in the data must be considered. Factors including time limitations, weather, snow and vegetative cover, outcrop exposure, and availability of helicopter landing sites prevented uniform sampling in all areas. Uneven sample density also resulted from more concentrated sampling of some areas which show evidence of mineralization such as iron-staining or visible metallic minerals. This practice has biased the data slightly in favor of samples containing values above true background levels. The

requirement of truly random sampling--that all potential samples have an equal likelihood of being selected--is not met. In addition, the rock samples were collected from a large area, where lithologic units of various origins or rock types may comprise several dissimilar geochemical populations. No attempt has been made here to group samples on the basis of geological or geochemical affinity. The summary of the values thus provides only a general indication of the trends that may be present.

Variability of any value is influenced by many factors, including the difficulty of obtaining representative samples of inhomogeneous media, variation in sample preparation, and variability inherent in the analytical techniques. It is likely with any large data-set that errors have occurred in recording, key-punching and editing the data which have gone undetected. Therefore, high values for a single element or a single site should be considered questionable indicators of bedrock mineralization.

Acknowledgments

We wish to thank several U.S. Geological Survey colleagues for their considerable cooperation and assistance. George Van Trump, Jr., provided invaluable aid by resolving computer-programming problems. Steven K. McDanal and Christine M. McDougal helped locate and collect computer data-files from previous projects and with entry of data into the computer. Michael F. Diggles worked tirelessly proofing enormous lists and cluttered maps. We also wish to thank Kenneth Eicher of TEMSCO Helicopters who was most generous with his time and advice; and

volunteered logistical assistance which greatly aided our field efforts. The skillful flying of TEMSCO pilot, Barry Roberts, allowed us to sample this particularly inaccessible terrain.

Table 4. Rock Name and Mineral Modifier Codes

Plutonic Rocks

GR - Granite
QM - Quartz Monzonite
GD - Granodiorite (including trondhjemite)
QD - Quartz Diorite
GB - Gabbro
DI - Diorite
UM - Ultramafic

Metamorphic Rocks

AM - Amphibolite
FV - Felsic Metavolcanics
GG - Granitic Gneiss
GS - Greenschist (mainly chlorite or chlorite-actinolite schist and phyllite)
MB - Marble
MG - Migmatite
MS - Metasediments (locally tuffaceous, including slate, argillite, gray phyllite)
MU - Undivided metamorphic rock
MV - Intermediate or mafic metavolcanics
PN - Paragneiss or schist
QF - Quartzofeldspathic schist or gneiss

Veins

VQ - Quartz vein, pod, lens ...
VN - Vein other than quartz

Dikes and Sills

DG - Granitic
DF - Felsic (not including DG, DP, DQ)
DQ - Quartz Porphoritic
DP - Pegmatitic
DM - Mafic or intermediate composition
DL - Lamprophyre

Other

BS - Basalt
FZ - Fault, shear, gouge or breccia

Mineral Modifiers

BA - Barite
CP - Chalcopyrite
GN - Galena
HM - Hematite
MG - Magnetite
MO - Molybdenite
PY - Pyrite
SL - Sphalerite

Table 5.-- STATISTICAL SUMMARY

TITLE
KETCHIKAN QUAD. ROCK GEOCHEM

S-AU CONTAINS NO VALID DATA POINTS. THEREFORE THIS VARIABLE WILL BE SKIPPED.

THE FREQUENCY DISTRIBUTIONS AND HISTOGRAMS ON THE FOLLOWING PAGES ARE ON LOGARITHMIC SCALES, AND EMPLOY THE SAME CLASS INTERVALS AS USED IN REPORTING 6-STEP SEMIQUANTITATIVE SPECTROGRAPHIC ANALYSES. IMPORTANT NOTE- THE STATISTICS GIVEN BELOW THE HISTOGRAMS ARE DERIVED ONLY FROM DATA VALUES WITHIN THE RANGES OF ANALYTICAL DETERMINATION, AND ARE, THEREFORE, BIASED IF DATA VALUES QUALIFIED WITH N, L, G, T, OR H CODES ARE PRESENT. SEE LATER SECTION OF OUTPUT FOR STATISTICAL ESTIMATES THAT ARE UNBIASED IN THIS REGARD. THE GEOMETRIC MEAN IS AN ESTIMATE OF "CENTRAL TENDENCY," OR OF A CHARACTERISTIC VALUE, OF A FREQUENCY DISTRIBUTION THAT IS APPROXIMATELY SYMMETRICAL ON A LOG SCALE, AND IS THEREFORE USEFUL FOR CHARACTERIZING MANY GEOCHEMICAL DISTRIBUTIONS. THE GEOMETRIC MEAN IS NOT AN ESTIMATE OF GEOCHEMICAL ABUNDANCE AND IS OF NO VALUE IN ESTIMATING RESERVES OR TOTAL AMOUNTS OF ELEMENTS PRESENT.

THE CUMULATIVE FREQUENCY PERCENTS GIVEN BELOW SHOULD BE PLOTTED AGAINST THE "LOWER" LIMITS TO GIVE THE LEPELTIER-TYPE CUMULATIVE CURVE.

TITLE
KETCHIKAN QUAD. ROCK GEOCHEM

IN THE COMPUTATIONS PERFORMED TO PRODUCE THE FOLLOWING TABLE OF GEOMETRIC MEANS AND DEVIATIONS, ALL ELEMENTS ARE IGNORED WHERE ONE OR MORE OF THE UNQUALIFIED DATA VALUES IS LESS THAN THE ANALYTICAL LIMIT OF DETECTION SPECIFIED ON INPUT OR WHERE ANY DATA VALUES ARE QUALIFIED WITH THE G (GREATER THAN) CODE. DATA VALUES QUALIFIED WITH B OR H ARE NOT USED IN THE COMPUTATIONS. WHERE NONE OF THE DATA VALUES FOR AN ELEMENT ARE QUALIFIED THE MEAN AND DEVIATION SHOULD BE THE SAME AS THOSE GIVEN IN THE PRECEDING SECTION. WHERE DATA ARE QUALIFIED WITH THE CODES N, L, OR T, THE ESTIMATES OF GEOMETRIC MEAN AND DEVIATION ARE BASED ON A METHOD BY A. J. COHEN FOR TREATING CENSORED DISTRIBUTIONS. THE APPLICATION OF THIS METHOD TO GEOCHEMICAL PROBLEMS IS DESCRIBED IN USGS PROFESSIONAL PAPER 574-B. THE ESTIMATES ARE UNBIASED IN A STRICT SENSE ONLY WHERE THE DATA ARE DERIVED FROM A LOGNORMAL PARENT POPULATION.
