James C. Ratté and Terry Grotbo

Open-File Report 79-1435

1979

Chemical analyses and norms of 81 volcanic rocks from parts of the Mogollon-Datil volcanic field, southwestern New Mexico

By James C. Ratté and Terry Grotbo

The analyzed rocks (tables 1-3) were collected during mineral resource studies of the Gila Wilderness study area (Ratté and Gaskill, 1975) and subsequent geologic mapping, which is continuing in the Mogollon-Datil volcanic field. For this preliminary release of data, the rocks are divided into three groups:

Group I - Rocks of the early andesitic complexes that largely predate major ash-flow eruptions and related cauldron subsidence in the area considered here. These rocks range generally from 30 to 35 million years in age.

Group II - Quartz latitic or dacitic to rhyolitic ash-flow tuffs and associated intrusive and extrusive rocks. These rocks range mainly from 25 to 30 million years in age; they overlap in time with the early andesitic complexes on the one end and with the post ash-flow tuff andesites and associated rocks on the other.

Group III - Post ash-flow tuff andesites and associated rocks. Most of these rocks are between 20 and 25 million years in age, but rocks as young as 5-6 million years are included in this group.

For general characterization and classification, the rocks have been plotted on an alkali-silica diagram (fig. 1), an AFM diagram (fig. 2), and a normative-color-index vs. normative-plagioclase-composition diagram (fig. 3). The alkali-silica plot shows most of the rocks to be in the subalkaline field. Three ash-flow tuff analyses fall in the alkaline field, but are probably beyond the main discriminating part of the divider. Otherwise, a number of the andesitic rocks plot in the alkaline field close to the dividing line, but only two analyses, nos. 80 and 81, are clearly separated from the others. These analyses represent alkali olivine basalt flows interlayered in Gila Conglomerate.

The AFM diagram (fig. 2) shows nearly all of the subalkaline rocks to be in the calc-alkaline series as opposed to the tholeiitic series, and there is no clear separation of rocks of tholeiitic affinity.

Rock names applied to the analyzed rocks on the location and correlation chart were derived from figure 3.

Analytical methods and analysts

Analytical methods:

Code

1. Two-solution method (Shapiro and Brannock, 1962). Supplemented by atomic absorption.
2. Single-solution method (Shapiro, 1975)
3. Single-solution method (Shapiro, 1967)

Analysts:

Artis, L.; Botts, S., Budinsky, J.; Chloe, G.; Elmore, P.; Glenn, J.; Kelsey, J.; Moore, R.; and Smith, H.

Table 3.--Description of analyzed rocks

Group I - Early andesitic rocks

Sample no.	Field no.	
1	SP-33-75	Gray, porphyritic lava flow in upper part of early andesitic complex. Contains microphenocrysts of olivine and pyroxene as well as plagioclase.
2	SP-7E-76	Gray, porphyritic, glassy monomictic vent(?) breccia with abundant plagioclase (andesine) and biotite phenocrysts, and amphibole and orthopyroxene microphenocrysts.
3	DM-3-76	Highly porphyritic, dull black glassy plug rock with abundant phenocrysts of plagioclase, pyroxene, and opaque oxide.
4	GR-88A	Blue-gray, porphyritic flow rock with about 15 percent 1-3 mm plagioclase and oxidized mafic phenocrysts.
5	GR-79C	Red, porphyritic flow rock with about 25 percent 1-4 mm plagioclase and minor biotite crystals from area of steep flow layering that may mark a plug.
6	GR-76A	Red, porphyritic flow rock with about 10-15 percent plagioclase and sparse green pyroxene phenocrysts.
7	GR-95A	Light-gray porphyritic flow rock with 1-3 mm altered feldspar phenocrysts in a pyritized and argillically altered matrix. Mafic phenocrysts, probably biotite, almost completely sericitized.
8	GR-47	Black rock with vitreous appearance has scattered pink feldspar crystals and glomeroporphyritic groups of plagioclase, pyroxene, and opaque oxide crystals in an aphanitic but holocrystalline matrix of flow-alined plagioclase microlites.
9	GR-41A	Gray vitrophyre with about 20-25 percent 1-5 mm white plagioclase (andesine) and 1 mm biotite books in a colorless glass. Minor pyroxene, xenocrystic(?) quartz, opaque oxide, and zircon. Another sample has K-Ar ages of 29.6±1.0 (sanidine) and 29.3±1.0 (biotite) m.y.
10	GR-35B	Fine-grained, light-gray, granitic rock with some 1-4 mm plagioclase phenocrysts, sparse altered biotite, and disseminated pyrite. The potassic feldspar has a K-Ar age of 29.7±1.0 m.y.

Table 3.--cont.

Sample no.	Field no.	
11	GR-33A	Fine-grained, dark-gray, vesicular flow rock with scattered olivine and pyroxene grains in a microlitic matrix of plagioclase (labradorite). Flows may correlate with andesitic flows that are younger than the volcanic complex of Alum Mountain.
12	GR-21D	Light-gray, fluidal, aphanitic rhyolite dike with sparse sodic plagioclase phenocrysts <1 mm long. Veinlets of quartz and magnetite commonly parallel the fluidal structure.
13	GR-20H	Light-gray, porphyritic flow rock with 10-15 percent 1-4 mm white plagioclase phenocrysts, partly sericitized biotite, greenish-yellow pyroxene, and rare quartz grains in an aphanitic matrix.
14	GR-18F	Dark-greenish-gray, porphyritic flow rock with abundant plagioclase (andesine) phenocrysts and biotite, altered pyroxene, and sparse amphibole microphenocrysts. Some granophyric quartz and feldspar in matrix.
15	GR-14	Dark-gray to black flow with with 4-5 mm plagioclase phenocrysts (andesine) in an aphanitic matrix of microphenocrysts and microlitic plagioclase. Microphenocrysts are biotite, pyroxene, and brown hornblende; rock also contains sparse rounded quartz xenocrysts.
16	GR-13B	Dark-gray, sparsely porphyritic rock from small stock or dike. Phenocrysts (10-15 percent) include plagioclase (oligoclase-andesine), biotite, and pyroxene. Rare quartz and sanidine xenocrysts(?).
17	GR-128C	Black vitrophyre with about 5 percent plagioclase (oligoclase-andesine), biotite, and pyroxene phenocrysts. Perlitic glass matrix is crowded with flow-alined microlites.
		Group II - Ash-flow tuffs and associated rocks
18	GR-50C	Reddish-brown, densely welded tuff with about 40 percent small phenocrysts, mainly plagioclase (andesine), minor biotite and opaque oxide, and rare pyroxene, zircon, and brown hornblende; from upper part of Cooney Tuff sequence of ash flows.
19	MR-4A-76	Pink to red, densely welded phenocryst-poor ash-flow tuff with 5-10 percent sanidine, partly argillized sodic plagioclase, and rare quartz phenocrysts from lithophyssal zone in bottom of Whitewater Canyon.

Table 3.--cont.

Sample no.	Field no.	
20	GR-59A	Greenish-gray, propylitically altered, densely welded ash-flow tuff with 30-40 percent altered plagioclase, biotite, and pyroxene phenocrysts.
21	GR-216A	Light-lavender-gray, densely welded ash-flow tuff with 25-30 percent 1-3 mm quartz and sanidine and minor plagioclase phenocrysts; practically no mafic minerals other than rare oxidized biotite and opaque oxide.
22	MR-11B-74	Light-lavender-gray, moderately welded, ash-flow tuff with 20-30 percent quartz, plagioclase, and sanidine phenocrysts and accessory biotite, opaque oxide, zircon, and apatite in a devitrified vitroclastic matrix. Irregular, angular quartz phenocrysts as large as 1/2 cm.
23	GR-157H	Light brown, pumice-rich, moderately welded ash-flow tuff with less than 5 percent tiny quartz, plagioclase, and sanidine (moonstone) phenocrysts. Compacted dark-brown to creamy-white pumice fragments are as much as several centimeters long.
24	MR-31-74	Light gray to nearly white, partially welded, porous vaporphase ash-flow tuff with rare tiny quartz, sanidine, and plagioclase phenocrysts, and small gray eutaxitic pumice generally <1 cm long in a devitrified microcrystalline matrix.
25	GR-70B	Pinkish-brown, finely eutaxitic to fluidal, phenocryst-poor, densely welded ash-flow tuff near base of unit. Five to ten percent phenocrysts are mostly sanidine and plagioclase plus accessory biotite, brown hornblende, pyroxene, sphene, zircon, and apatite.
26	GR-142C	Pinkish-gray, densely welded tuff with abundant small white feldspar phenocrysts and scattered bronze biotite 1-2 mm in diameter, from near top of ash-flow tuff sheet.
27	SP-5B-75	Red, densely welded ash-flow tuff with 20-25 percent phenocrysts of alined glassy plagioclase, and rare sanidine, scattered brown biotite, and sparse green pyroxene in a devitrified matrix. Sample is from 10-20 meters below top of ash-flow tuff sheet.
28	GR-70H	Light- to medium-gray, fine-grained flow rock with small plagioclase laths and dark-green pyroxene grains 1 mm or less in a fairly coarse microlitic matrix.

Table 3.--cont.

Sample no.	Field no.	
29	GR-180J	Reddish-brown, porphyritic flow rock with about 10 percent 1-4 mm plagioclase (andesine) laths and sparse pyroxene and opaque oxide microphenocrysts in a felted microlitic matrix. Mafics are highly oxidized.
30	DG-155	Light-gray, densely welded ash-flow tuff with abundant quartz and sanidine phenocrysts and accessory brown hornblende, opaque oxides, sphene, biotite, and zircon in a microeutaxitic to granophyric matrix.
31	DG-344	Light-gray, densely welded ash-flow tuff with abundant quartz and sanidine phenocrysts and minor accessory biotite, sphene, and opaque oxides in a devitrified matrix.
32	GR-8B	Light-gray, moderately to densely welded ash-flow tuff with 10-20 percent quartz and sanidine phenocrysts and eutaxitic pumice several cm long in a granophyric to cryptocrystalline matrix.
33	GR-129A	Light-gray, densely welded ash-flow tuff with eutaxitic white pumice several cm long and 10-15 percent 1-3 mm phenocrysts of sanidine and amoebic quartz grains, and smaller, yellow, euhedral sphene grains, opaque oxide, and rare brown hornblende and biotite in an aphanitic devitrified matrix.
34	MR-41-74	Pink, densely welded ash-flow tuff with 20-25 percent 1-3 mm quartz and sanidine phenocrysts in a devitrified eutaxitic matrix. Rare accessory minerals include sodic plagioclase, opaque oxide, sphene, biotite, and zircon.
35	DG-176	Pink, densely welded ash-flow tuff with abundant quartz and sanidine phenocrysts in a devitrified cryptocrystalline matrix.
36	DG-347	Reddish-brown, densely welded ash-flow tuff with 25-30 percent feldspar and scattered biotite phenocrysts. Quartz, sphene, and opaque oxides common in a devitrified matrix.
37	DG-342	Reddish-gray, densely welded ash-flow tuff with abundant feldspar, quartz, and biotite phenocrysts in an aphanitic, devitrified matrix.
38	GR-99G	Reddish-gray, densely welded ash-flow tuff with 55 percent 1-3 mm phenocrysts, which include white, somewhat skeletal sanidine, glassy plagioclase, quartz, rare black biotite and accessory opaque oxide, sphene, zircon, and apatite in a devitrified microeutaxitic, cryptocrystalline to granophyric matrix.

Table 3.--cont.

Sample no.	Field no.	
39	GR-107C	Reddish-brown, densely welded ash-flow tuff that contains abundant phenocrysts of sanidine with a sericitic sheen, and quartz in a devitrified cryptocrystalline matrix with granophyric eutaxitic pumice. Rock looks similar to tuff of Apache Spring, but rare plagioclase and foreign lithic fragments support its chemical similarity to Bloodgood Canyon Tuff, and thus sample is apparently from a block of Bloodgood Canyon Tuff enclosed in the younger tuff of Apache Spring.
40	GR-71A	Gray, porphyritic flow rock with 15-20 percent 1-3 mm quartz and feldspar phenocrysts in an aphanitic granophyric to micropegmatitic matrix. Rare biotite is largely altered to sericite.
41	GR-84B	Pink, porphyritic flow rock with 1-4 mm perthitically altered pink sanidine and quartz phenocrysts. Sparse plagioclase and accessory biotite, opaque oxide, apatite, sphene, and zircon are present in a micropegmatitic matrix.
42	GR-62F	Reddish-gray, porphyritic flow rock with 10-15 percent argillized feldspar and altered mafic phenocrysts in an aphanitic granophyric to micropegmatitic matrix.
43	GR-101C	Gray, porphyritic flow rock with about 30 percent quartz and feldspar phenocrysts in an aphanitic matrix that contains sparse opaque oxide, biotite, apatite, and zircon, and has a granophyric to micropegmatitic texture.
44	GR-34A	Light-gray, aphanitic rhyolite with <1 percent very sparsely scattered 1-2 mm quartz and sanidine phenocrysts and a rare flake of biotite . White lenticular lithophysae commonly have a medial lens of tridymite.
45	GR-74B	Light-gray, rhyolite porphyry with <5 percent inconspicuous quartz and sanidine phenocrysts in an aphanitic micropegmatitic to aplitic matrix containing numerous plumose spherulites.
46	GR-200B	White, friable, lithophysal rhyolite with 5-10 percent sanidine and amethystine quartz phenocrysts as much as 1/2 cm in diameter. Crystalline hematite or other metallic oxides project into some lithophysal cavities.
47	GR-125C	Light-gray to nearly white, strongly flow-banded porphyritic rhyolite with about 5 percent quartz and sanidine phenocrysts as much as 1/2 cm in diameter in an aphanitic granophyric to micropegmatitic matrix. Wisps of fine muscovite, rare oxidized biotite, and sphene in thin sections. Vugs 1-2 cm long are alined with amethystine quartz.

no.	no.	
48	GR-59B	Light-pinkish-gray rhyolite porphyry dike with about 1-2 percent, 1-2 mm quartz phenocrysts and rare 1-3 mm pink sanidine phenocrysts, and a rare flake of biotite in an aphanitic granophyric to spherulitic matrix.
49	GR-56B	Light-pinkish-gray, porphyritic flow rock with about 20 percent 1-4 mm phenocrysts and microphenocrysts that are predominantly sodic plagioclase, and some quartz plus biotite, brown amphibole, pyroxene and opaque oxide, sphene, and zircon in a spherulitic to glassy matrix.
50	DG-161	Light-gray rhyolite flow rock with about one or two percent scattered quartz phenocrysts in an aphanitic matrix.
51	GR-113B	Light-pink, pumiceous, poorly welded ash-flow tuff with about 20 percent quartz, feldspar, and biotite phenocrysts mostly <1 mm, and a few lithic lapilli in a devitrified cryptocrystalline matrix.
52	DG-175	Light-brown to white flowbanded rhyolite with about 1 percent quartz, sanidine, and plagioclase microphenocrysts in a spherulitic to cryptocrystalline matrix.
53	GR-54G	Light-lavender-gray, irregularly fluidal rhyolite with about 1 percent 1-2 mm pinkish-white plagioclase crystals in an aphanitic cryptocrystalline to granophyric matrix.
54	GR-66B	Massive, white, aphanitic rhyolite with less than 1 percent tiny quartz and feldspar crystals in a microgranular matrix much clouded with fine clay.
	Group III	Post-ash-flow tuff andesites and associated rocks
55	DG-10	Gray, amygdaloidal, aphanitic flow rock with rare yellow-green pyroxene crystals <1 mm long and sparse but conspicuous small quartz xenocrysts.
56	MR-7-74	Dark-gray, aphanitic flow rock with small white amygdules, and scattered brown, oxidized mafic phenocrysts generally <1 mm long. Rock is about 98 percent flow-alined plagioclase microlites with scattered red-orange iddingsite after olivine.
57	MR-6-74	Gray-black, subvitreous, amygdaloidal flow rock with sparse tiny glassy-brown olivine grains in an aphanitic matrix. Microphenocrysts (<5 percent) of plagioclase, pyroxene, and olivine are in a flow-alined microlitic plagioclase matrix.
58	MR-43A-74	Zebra-striped (flow-banded) purplish-gray rock with sparse tiny oxidized mafic crystals in a matrix of microlitic plagioclase.

Table 3.--cont.

Sample no.	Field no.	
59	MR-51A-74	Black, glassy flow rock with small white amygdules and sparse glomeroporphyritic clots. About 1 percent plagioclase (andesine-labradorite) and pyroxene microphenocrysts in a matrix of fine-grained plagioclase and mafic granules with an intersertal texture.
60	MR-81B-75	Gray, aphanitic, vesicular flow rock with a flow-alined microlitic texture of andesine-labradorite microlites and opaque oxide and pyroxene granules. Sample is from flows above 20-meter purplish-gray sandstone lens within flow sequence.
61	MR-81A-75	Reddish-brown, aphanitic, vesicular flow rock with a dictytaxitic, microlitic matrix which contains abundant small subhedral opaque grains and local areas of ophitic-textured pyroxene and plagioclase.
62	OB-4E-76	Gray, massive, aphanitic flow rock with tiny (<1 mm) rare olivine phenocrysts. Flow-alined microlitic plagioclase matrix contains sparse iddingsitic olivine and pyroxene microphenocrysts.
63	GR-54A	Black, subvitreous, massive flow rock with a few scattered 1-2 mm plagioclase phenocrysts. Sparse andesine and both clinopyroxene and orthopyroxene in a microlitic plagioclase and cryptocrystalline matrix. Rare but conspicuous quartz xenocrysts have reaction borders of pyroxene.
64	GR-6B	Gray, finely vesicular flow rock with andesine and clinopyroxene in dichtytaxitic, microlitic texture with sparse scattered opaque oxide and pyroxene microphenocrysts.
65	GR-6A	Dark-gray, blotchy, massive flow rock with a diabasic texture of clinopyroxene, altered olivine, andesine, and opaque oxide.
66	DG-6	Brownish-gray, dichtytaxitic to diabasic, amygdaloidal flow rock with common opaque oxide and minor plagioclase and clinopyroxene phenocrysts.
67	DG-5	Dark-gray, aphanitic flow rock with clinopyroxene and opaque oxide grains in a dichtytaxitic microlitic plagioclase matrix.
68	DG-3	Brownish-gray, aphanitic flow rock of clinopyroxene grains and trachytoid plagioclase.
69	GR-110A	Gray, aphanitic flow rock with a few small vesicles and microphenocrysts of plagioclase, and rare pyroxene in a flow-alined matrix of microlitic plagioclase.

Table 3.--cont.

Sample no.	Field no.	
70	GR-176A	Greenish-gray, fine-grained, intrusive rock consisting largely of altered subhedral plagioclase crystals with interstitial microlitic to micropegmatitic quartz and feldspar.
71	MR-48D-74	Gray, fine-grained, hypabyssal intrusive rock with small 1-4 mm plagioclase (andesine) and hornblende phenocrysts in a fine-grained matrix.
72	EP-3-75	Gray, fine-grained hypabyssal intrusive rock with abundant 1 mm and smaller plagioclase and pyroxene phenocrysts in a cryptocrystalline to glassy matrix. Orthopyroxene is more abundant than augitic pyroxene.
73	SP-50A-75	Mottled gray flow rock with labradorite phenocrysts several cm long locally, and augitic pyroxene phenocrysts as much as 1-2 cm long. Plagioclase, olivine, and pyroxene intergrown in a subophitic texture.
74	OB-7E-76	Dark-gray, fine-grained amygdaloidal flow rock. Felted microlitic labradorite forms polygonal to radial mosaic pattern with interstitial olivine, pyroxene, and opaque oxide grains.
75	SP-42-75	Black, vesicular, subvitreous flow rock with sparse small (1 mm) olivine and plagioclase phenocrysts in a very fine grained microlitic matrix of flow-alined andesine and interstitial pyroxene.
76	SP-27B-75	Gray, fine-grained hypabyssal intrusive rock with abundant andesine, hornblende, and pyroxene phenocrysts 1-2 mm or smaller in a microgranular matrix.
77	BR-10-74	Dark-gray, aphanitic flow rock with about 10 percent small phenocrysts and microphenocrysts of andesine-labradorite, olivine, and opaque oxide in a microlitic plagioclase matrix.
78	BB-16E-76	Gray, porphyritic hypabyssal intrusive rock with about 15 percent phenocrysts including pink plagioclase and amethystine quartz as much as 1 cm long, and smaller mafic phenocrysts of biotite, greenish-yellow hornblende, sphene, and pyroxene. Some of quartz phenocrysts (or xenocrysts) have reaction rims with pyroxene; others show only corroded borders.
79	GL-2-74	Dark-gray, finely vesicular aphanitic flow rock with sparse green olivine crystals. Microscopically, rock has a diabasic texture of calcic plagioclase laths, olivine, and pyroxene.

Table 3.--cont.

Sample no.	Field no.	
80	GR-30C	Dark-gray to black, massive to vesicular, aphanitic flow rock with sparsely scattered olivine and pyroxene microphenocrysts in a poorly alined microlitic plagioclase matrix.
81	GR-26D	Dark-gray, flow-banded, aphanitic flow rock with rare small (<1 cm) ultramafic inclusions. Less than 1 percent olivine phenocrysts in a well-alined microlitic plagioclase matrix with interstitial olivine and pyroxene and opaque oxide grains.
